**RE: SUMMARY OF SOIL AND GROUNDWATER ACTIVITIES CONDUCTED
 AT THE AC TRANSIT FACILITY LOCATED AT 1177 47th STREET,
 EMERYVILLE, CALIFORNIA**

Dear Mr. Gholami,

This letter and the attached figures, tables and appendices have been prepared on behalf of AC Transit, to summarize the soil and groundwater issues at their Emeryville, California facility located at 1177 47th Street, Emeryville, California (Figure 1). In August 1999, the Alameda County Health Care Services Agency (ACHCS), requested resumption of quarterly groundwater monitoring associated with historic total petroleum hydrocarbon (TPH) releases from the facility's underground storage tanks (USTs) and delivery system. In May 2000, the ACHCS requested additional subsurface investigation work to further define the extent of TPH in groundwater downgradient of the existing monitor well network.

In 1999, 14 groundwater monitor wells (MW-1 through MW-10 and W-1 through W-4) were located at the site (Figure 2). In 1999, it was determined that the casing in monitor well W-2 was bent at a depth of three feet below grade, preventing the lowering of a bailer for sample collection. Monitor well W-2 was subsequently abandoned. In December 1999, six USTs located in Tank Farm No. 2 (Figure 2) were excavated and removed under oversight from the ACHCS. The location of samples collected during the UST removal are shown on Figure 3 and analytical results from soil and groundwater samples collected during the removal are presented in Tables 1 and 2, respectively.

Additional subsurface investigation work conducted in 2001 included the installation of soil borings SB-1a through SB-4a installed in the vicinity of former Tank Farm No. 2 and the installation of soil borings SB-5a through SB-8a located along the downgradient property boundary. After reviewing the results from samples collected from soil borings SB-1a through SB-8a, three additional monitor wells (MW-11 through MW-13) were installed at the site. Figure 2 shows the location of the monitor wells and soil borings. Figure 2 also displays the location of facility buildings, former and existing UST locations and subsurface utilities.

During third quarter 2002 groundwater monitoring conducted at the site, an approximate seven-foot free phase product layer was measured in monitor well MW-13. This was the first measurable product layer recorded in this monitor well. Subsequent testing conducted by AC Transit on the hydraulic lift system located in the Tire Shop located near monitor well MW-13, confirmed that one of the hydraulic hoists had leaked. The lift was immediately taken out of service. ACHCS was notified of the release by AC Transit in a letter dated November 6, 2002.

On November 13, 2002, removal of the free phase product from monitor well MW-13 was initiated. Product layer removal consisted of pumping the free phase layer from the well on a daily basis. By November 20, 2002 the layer had been reduced to a sheen (< 0.01 feet).

On February 18, 2003, five soil borings (SB-1b through SB-5b) were installed in the vicinity of the Tire Building to assess the extent of the impact of hydraulic oil (Figure 2). At the request of ACHCS a sixth boring (SB-6b) was located downgradient of a 1,000-gallon UST used by the facility's emergency generator. The review of analytical results from samples collected from soil borings SB-1b through SB-5b, resulted in a second investigation focused along Doyle Street, located downgradient of the site. Soil borings SB-7b through SB-12b were installed within Doyle Street to better define the extent of TPH downgradient of the site. At the request of ACHCS, two additional borings SB-13b and SB-14b were installed onsite to sufficient depths to define a sand layer encountered in monitor wells W-1, W-2 and MW-13.

Analytical data collected from the soil borings and monitor wells through November 2005 are presented in Tables 1 and 2, respectively. Depth to water measurements and groundwater elevations from quarterly monitoring events are presented in Table 3. Monitor well completion depths, screen intervals and casing sizes are presented in Table 4. Available boring logs are included in Appendix A.

Concentrations of chemicals above State of California Maximum Contaminant Levels (MCLs) or Environmental Screening Levels (ESLs) are limited to TPH and related compounds in groundwater. The extent of the groundwater plume is presented in Figure 2 and is limited to the shallow aquifer presented in cross-section in Figure 4. The potentiometric surface map from the October 2005 monitoring events is included as Figure 5. Groundwater flows to the west – southwest, at a gradient of 0.022 feet/foot. Groundwater data associated with quarterly monitoring can be accessed through the State of California GeoTracker system with facility global identification number T0600118672.

To assess the potential for impacts to sensitive receptors through groundwater, a Well Completion Report Release Agreement was filed with the County of Alameda Public Works Agency. The well completion report provided a listing of all the wells installed within a 1/2-mile radius of the Site. The tabulated list of wells is included in Appendix B. The well completion report found a total of 338 wells, none of which are used for domestic or municipal supply.

Based on the current known extent of the groundwater plume, location of facility buildings, property boundaries and absence of domestic or municipal supply wells, there are no likely exposure pathways to sensitive receptors. Additionally, access to the Site is restricted to authorized personnel making exposure of the general public unlikely.

AC Transit desires to conduct additional investigative work to define the downgradient extent of the groundwater plume. A workplan detailing the scope of the investigation and presenting the methodologies will be prepared for submittal to ACHCS. The results from the additional

Mr. Amir Gholami

investigation will be used to assess the need to conduct a feasibility study to develop site-specific cleanup goals and potential remedies.

If you should have any questions regarding the contents of this letter and attachments, please feel free to contact either Ms. Suzanne Chaewsky of AC Transit at (510) 577-8869 or myself at (510) 769-3563.

Sincerely,

bwright@actransit.com

APPENDIX B

WELL COMPLETION REPORT

Well Legend

DOM=Domestic well

IRR=Irrigation well

MUN= Municipal well

IND=Industrial well

CAT=Cathodic well

DES=well destroyed (through permit)

ABN=Abandoned and not being used (but has not been destroyed through permit process)

TES=Test well

BOR= Geotechnical investigation

MON= Monitoring well

EXT=Extraction/ Vapor wells

PIE=Piezometers

REC=Recovery well (extraction/ vapor)

? = Unknown or no information found or given
