ACEH Fuel Leak Case No. RO0000409
RWQCB Case No. 01-2474
GeoTracker Global ID T0600102279

I have reviewed the attached report dated March 10, 2014.

I agree with the conclusions and recommendations presented in the referenced report. The information in this report is accurate to the best of my knowledge and all local Agency/Regional Board guidelines have been followed. This report was prepared by AECOM, upon whose assistance and advice I have relied.

This letter is submitted pursuant to the requirements of California Water Code Section 13257(b)(1) and the regulating implementation entitled Appendix A pertaining thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge.

Sincerely,

A handwritten signature in blue ink, appearing to read "Nicole Arceneaux".

Subject: First Quarter 2014 Semiannual Groundwater Monitoring and Sampling Report
76 Service Station No. 1156 (351645)
4276 MacArthur Boulevard, Oakland, California
Fuel Leak Case No. RO0000409 and GeoTracker Global ID T0600102279

Dear Mr. Wickham:

On behalf of Chevron Environmental Management Company's (EMC's) affiliate, Union Oil Company of California ("Union Oil"), AECOM is pleased to submit the first quarter 2014 semiannual groundwater monitoring and sampling report for the site located at 4276 West MacArthur Boulevard in Oakland, California (**Figure 1**).

The locations of site features are illustrated on **Figure 2**. Groundwater monitoring is conducted to evaluate the distribution of petroleum hydrocarbon constituents in groundwater beneath the site. The fieldwork was performed by Gettler-Ryan Inc. (GR). This report summarizes results for the groundwater samples collected from the wells associated with the site during the first quarter of 2014.

Groundwater Level Measurements

Well construction details are presented in **Table 1**. Depth to groundwater measurements were recorded for 10 on-site monitoring wells (MW-1B, MW-2B, MW-3B, MW-4B, MW-9A, MW-9B, MW-10A, MW-10B, MW-11A, and MW-11B) and for two off-site monitoring wells (MW-5 and MW-7) on January 16, 2014, and are presented in **Table 2**. Groundwater measurements were used to construct a groundwater elevation contour map included as **Figure 3**. The depth to groundwater ranged from 2.82 (MW-5) to 9.41 (MW-10A) feet below the top of well casings.

The groundwater flow direction on-site was calculated to flow in a west-southwest direction with an average hydraulic gradient of approximately 0.07 feet per foot (ft/ft). Groundwater elevation data collected from the recently installed shallow monitoring wells are consistent with the determined flow direction and gradient. The groundwater flow direction and gradient are similar to the third quarter 2013 monitoring event (0.07 ft/ft, west-southwest). Copies of the groundwater sampling/purge logs are included in **Attachment 1**.

Groundwater Sampling and Analytical Results

Groundwater samples were collected from wells MW-1B, MW-2B, MW-3B, MW-4B, MW-5, MW-7, MW-9A, MW-9B, MW-10A, MW-10B, MW-11A, and MW-11B. The groundwater samples were submitted to BC Laboratories, Inc. in Bakersfield, California, for analysis of total petroleum hydrocarbons-gasoline range organics (TPH-GRO) by Environmental Protection Agency (EPA)

Method 8015B; total petroleum hydrocarbons-diesel range organics (TPH-DRO) by EPA Method 8015B/TPH-d with silica gel cleanup; benzene, toluene, ethylbenzene and total xylenes (BTEX) by EPA Method 8020; fuel oxygenate compounds: methyl t-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl t-butyl ether (ETBE), t-amyl methyl ether (TAME), t-butyl alcohol (TBA), 1,2-dibromoethane (EDB), 1,2-dichloroethane (EDC), ethanol by EPA Method 8260B; and oil and grease by EPA Method 1664A HEM. The samples were also analyzed for monitored natural attenuation (MNA) parameters: dissolved methane by EPA Method RSK-175M, dissolved nitrate, and dissolved sulfate by EPA Method 300.0; dissolved ferrous iron by SM Method 3500-FeD, and dissolved manganese by EPA Method 200.8.

Groundwater sampling results from this sampling event for oil and grease, TPH-DRO, TPH-GRO, BTEX, MTBE, TBA, ethanol, EDC, DIPE, ETBE, and TAME are summarized in **Tables 2 and 3**. MNA parameters are summarized in **Table 4**. Historical groundwater sampling results for these compounds are provided in **Tables 5 and 6**. Additional historical analytes are provided in **Tables 7a through 7k**. A map depicting dissolved concentrations of TPH-DRO, TPH-GRO, BTEX, MTBE, and TBA in groundwater on January 16, 2014, is included as **Figure 4**. A copy of the certified laboratory analytical report with chain-of-custody documentation is included in **Attachment 2**.

The most recent monitoring data (first quarter 2014) for adjacent Former Shell Service Station No. 13-5701 (ACEH Case No. RO0000486, 4255 MacArthur Boulevard) is included as **Attachment 3** for reference.

Interpretation of Groundwater Data and Recommendations for Future Action

Based on historical site assessments, the initial depth to water determined during well installations indicated the presence of a confined aquifer under hydrostatic pressure. Based on historical soil boring logs, and well installation in March 2013, it was concluded that the lithology beneath the site is relatively fine-grained, however, the aquifer is generally unconfined.

Based on soil moisture observed in historical soil boring logs, initial hydrogeologic evaluation (i.e., confined aquifer under hydrostatic pressure) was likely inaccurate. This inaccuracy is further evidenced by shallow monitoring wells (MW-9A/B, MW-10A/B, and MW-11A/B) exhibiting a hydraulic head consistent with those installed to 25 feet below ground surface (bgs), and that recharge did occur after purging during the most recent monitoring event. Soil observed during installation of these six wells was interpreted to be dry from approximately 11.5 to 16 feet bgs, at which point the soil appeared to be moist. High-plasticity clays were observed for most soil borings from grade to total depth (15 to 20 feet bgs), which suggests a misinterpretation of static water during drilling activities. Following a review of historical boring logs, shallow depth to water was verified at several locations (SB-1, SB-4, SB-5, and SB-15), and almost all boring logs indicate high moisture content from approximately 5 feet bgs and deeper.

Based on recent groundwater analytical data (MW-9A/B, MW-10A/B, and MW-11A/B), a non-uniform vertical distribution of groundwater impacts is evident at the subject site, likely due to the fine-grained nature of the subsurface soil. Although concentrations for the shallowest-screened wells (10 to 15 feet bgs) are the highest, horizontal migration appears to be impeded by the soil type, as the plume appears to be largely contained to the site boundaries. Off-site, downgradient wells (MW-5 and MW-7) are screened from 5 to 25 feet bgs. Both wells have exhibited a declining trend for TPH-GRO, benzene, and MTBE since installation in 2001, suggesting that plume migration from the site is not occurring. In addition, the vertical migration of hydrocarbons appears to be limited. Impacts for deep-screened wells (20 to 25 feet bgs) are as much as four orders of magnitude less than those observed in the shallow-screened wells (10 to 15 feet bgs).

Groundwater samples collected on January 16, 2014, were analyzed for MNA parameters including dissolved methane, dissolved nitrate, dissolved sulfate, dissolved ferrous iron, and dissolved manganese, to evaluate if natural attenuation by anaerobic biodegradation is occurring beneath the site. Based on the analytical results for MNA parameters, depleted concentrations of nitrate and sulfate (electron donors for anaerobic reduction) were observed for wells within the dissolved-phase hydrocarbon plume when compared to results from wells outside of the dissolved-phase hydrocarbon plume. Additionally, ferrous iron and manganese concentrations (byproducts of anaerobic reduction) are generally elevated for wells within the dissolved-phase hydrocarbon plume when compared to wells outside of the dissolved-phase hydrocarbon plume. Within the source area, dissolved methane (product of anaerobic hydrocarbon digestion) is also found to be elevated when compared to wells outside of the dissolved-phase hydrocarbon plume. These geochemical trends are indicative of anaerobic biodegradation occurring within the dissolved-phase hydrocarbon plume.

AECOM recommends reducing the current groundwater monitoring schedule, as some wells have consistently contained low to non-detect concentrations of dissolved-phase petroleum hydrocarbons. AECOM recommends reducing the sampling frequency of MW-1B, MW-2B, MW-4B, MW-5, MW-7, and MW-9B to an annual basis. The reduction in sampling frequency will continue to provide adequate coverage across the site for calculating groundwater gradient and flow direction, and tracking contaminant trends. Additionally, the proposed sampling frequency will reduce the amount of street work required in MacArthur Boulevard. The following table summarizes the proposed sampling schedule:

Proposed Reduced Frequency Sampling Schedule

First Quarter Sampling Event	Third Quarter Sampling Event
All Wells	MW-3B, MW-9A, MW-10A, MW-10B, MW-11A, and MW-11B

Activities Completed for This Period

GR conducted groundwater monitoring and sampling on January 16, 2014.

Activities Planned for Next Period

The next groundwater monitoring and sampling event will be conducted in July 2014, and will be coordinated with adjacent Former Shell Service Station No. 13-5701. Pending ACEH approval, AECOM will implement the proposed reduced frequency sampling schedule for the third quarter 2014 consisting of wells MW-3B, MW-9A, MW-10A, MW-10B, MW-11A, and MW-11B.

Additionally, AECOM has prepared and submitted a work plan to further evaluate the lateral and vertical extents of soil and groundwater impacts beneath the site, and will implement the work plan upon receipt of ACEH approval.

Remarks/Signatures

The interpretations in this report represent our professional opinions and are based, in part, on the information supplied by the client. These opinions are based on currently available information and are arrived at in accordance with currently accepted hydrogeologic and engineering practices at this time and location. Other than this, no warranty is implied or intended.

If you have any questions regarding this project, please contact Brenda Evans at (805) 233-3988.

Sincerely,

Brenda Evans
Senior Project Manager

QA	1/16/2014	--	--	--	--	--

NOTES:

Methane analyzed by RSK-175M

Nitrate as NO₃ and sulfate analyzed by Environmental Protection Agency (EPA) Method 300.0

Iron (II) Species analyzed by SM-3500-FeD

Dissolved Manganese analyzed by EPA Method 200.8

ND<# = Analyte not detected at or above indicated practical quantitation limit

-- = Not sampled

µg/L = Micrograms per liter

mg/L = Milligrams per liter

QA = Trip blank

ID = Identification

---------	-----------------	--------------	-------------	---------------	--------------	-----------------------------	-------------------------------	------------------------------	-------------	-------------	-------------	-------------	----------

NOTES:

* TOC and GWE are in feet above mean sea level

TOC = top of casing

DTW = Depth to water below TOC

LNAPL = Liquid non-aqueous phase liquid

GWE = Groundwater elevation

ND<# = Analyte not detected at or above indicated practical quantitation limit

-- = Not available/not sampled

µg/L = Micrograms per liter

GC/MS = Gas chromatograph/mass spectrometer

ID = Identification

TPH-DRO = Total petroleum hydrocarbons-diesel range organics

SGC = Silica gel cleanup

TPH-GRO = Total petroleum hydrocarbons-gasoline range organics

B = Benzene

T = Toluene

E = Ethylbenzene

X = Total xylenes

NOTES:

ND<# = Analyte not detected at or above indicated practical quantitation limit

µg/L = Micrograms per liter

-- = Not available

MTBE = Methyl t-butyl ether

TBA = t-butyl alcohol

EDB = 1,2-dibromoethane

1,2-EDC = 1,2-dichloroethane

DIPE = Diisopropyl ether

ETBE = Ethyl t-butyl ether

TAME = t-amyl methyl ether

ID = Identification

Comments _____

STANDARD OPERATING PROCEDURE - GROUNDWATER SAMPLING

Gettler-Ryan Inc. (GR) field personnel adhere to the following procedures for the collection and handling of groundwater samples prior to analysis by the analytical laboratory. All work is performed in accordance with the GR Health & Safety Plan and all client-specific programs. The scope of work and type of analysis to be performed is determined prior to commencing field work.

Prior to sampling, the presence or absence of free-phase hydrocarbons is determined using an interface probe. Product thickness, if present, is measured to the nearest 0.01 foot and is noted in the field notes. In addition, all depth to water level measurements are collected with a static water level indicator and are also recorded in the field notes, prior to purging and sampling any wells.

After water levels are collected and prior to sampling, if purging is to occur, each well is purged a minimum of three well casing volumes of water using pre-cleaned pumps (stack, peristaltic or Grundfos), or disposable bailers. Temperature, pH and electrical conductivity are measured a minimum of three times during the purging (additional parameters such as dissolved oxygen, oxidation reduction potential, turbidity may also be measured, depending on specific scope of work.). Purging continues until these parameters stabilize.

Groundwater samples are collected using disposable bailers. The water samples are transferred from the bailer into appropriate containers. Pre-preserved containers, supplied by analytical laboratories, are used. When pre-preserved containers are not available, the laboratory is instructed to preserve the sample as appropriate. Duplicate samples are collected for the laboratory to use in maintaining quality assurance/quality control standards, as directed by the scope of work. The samples are labeled to include the job number, sample identification, collection date and time, analysis, preservation (if any), and the sample collector's initials. The water samples are placed in a cooler, maintained at 4°C for transport to the laboratory. Once collected in the field, all samples are maintained under chain of custody until delivered to the laboratory.

The chain of custody document includes the job number, type of preservation, if any, analysis requested, sample identification, date and time collected, and the sample collector's name. The chain of custody is signed and dated (including time of transfer) by each person who receives or surrenders the samples, beginning with the field personnel and ending with the laboratory personnel.

A laboratory supplied trip blank accompanies each sampling set. The trip blank is analyzed for some or all of the same compounds as the groundwater samples.

As requested by Chevron Environmental Management Company, the purge water and decontamination water generated during sampling activities is transported by Clean Harbors Environmental Services to Seaport Environmental located in Redwood City, California.

AECOM
1220 Avenida Acaso
Camarillo, CA 93012

Reported: 01/30/2014 11:48
Project: 1156
Project Number: 351645
Project Manager: Brenda Evans

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A10	PQL's and MDL's were raised due to matrix interference.
A52	Chromatogram not typical of diesel.
Q02	Matrix spike precision is not within the control limits.

Attachment 3

**Adjacent Site Monitoring Data – Former Shell Service Station

Notes:

TPHg = Total petroleum hydrocarbons as gasoline analyzed by EPA Method 8260B; prior to July 24, 2001, analyzed by EPA Method 8015 unless otherwise noted.

BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed by EPA Method 8260B; prior to July 24, 2001, analyzed by EPA Method 8020.

TABLE 1

**GROUNDWATER DATA
FORMER SHELL SERVICE STATION
4255 MACARTHUR BOULEVARD, OAKLAND, CALIFORNIA**

Well ID	Date	TPHg ($\mu\text{g/L}$)	MTBE				1,2-DCA				Depth to Water (ft MSL)	GW Elevation (ft TOC)	SPH Thickness (ft)	DO Reading (mL)	ORP Reading (mV)
			B ($\mu\text{g/L}$)	T ($\mu\text{g/L}$)	E ($\mu\text{g/L}$)	X ($\mu\text{g/L}$)	8020	8260	TBA ($\mu\text{g/L}$)	DIPE ($\mu\text{g/L}$)	ETBE ($\mu\text{g/L}$)	TAME ($\mu\text{g/L}$)	EDB ($\mu\text{g/L}$)	DCA ($\mu\text{g/L}$)	Ethanol ($\mu\text{g/L}$)

MTBE = Methyl tertiary-butyl ether analyzed by method as noted

TBA = Tertiary-butyl alcohol analyzed by EPA Method 8260B

DIPE = Di-isopropyl ether analyzed by EPA Method 8260B

ETBE = Ethyl tertiary-butyl ether analyzed by EPA Method 8260B

TAME = Tertiary-amyl methyl ether analyzed by EPA Method 8260B

EDB = 1,2-dibromoethane analyzed by EPA Method 8260B

1,2-DCA = 1,2-dichloroethane analyzed by EPA Method 8260B

Ethanol analyzed by EPA Method 8260B.

TOC = Top of casing elevation, in feet relative to mean sea level

SPH = Separate-phase hydrocarbon

GW = Groundwater

DO = Dissolved oxygen

ORP = Oxidation reduction potential

$\mu\text{g/L}$ = Micrograms per liter

ft = Feet

MSL = Mean sea level

m/L = Milligrams per liter

mV = Millivolts

<x = Not detected at reporting limit x

--- = Not analyzed or not available

(D) = Duplicate sample

a = Groundwater surface had a sheen when sampled.

b = MTBE value is estimated by laboratory

c = The concentration reported reflects individual or discrete unidentified peaks not matching a typical fuel pattern.

d = Secondary ion abundances were outside method requirements. Identification based on analytical judgment.

e = pH>2

f = Sample analyzed outside the EPA recommended holding time.

g = Analyzed by EPA Method 8015B (M).

h = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based upon the specified standard.

i = Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.

j = Hydrocarbon result partly due to individual peak(s) in quantitation range.

k = TPHg concentration is due to the presence of discrete peaks of MTBE.

When SPHs are present, groundwater elevation is adjusted using the relation: Corrected groundwater elevation = TOC - Depth to Water + (0.8 x Hydrocarbon Thickness).

Site wells surveyed March 14, 2002 by Virgil Chavez Land Surveying

Wells MW-6, MW-7, MW-8 and MW-9 surveyed July 12, 2006 by Virgil Chavez Land Surveying
