## RECEIVED

By Alameda County Environmental Health 11:12 am, Oct 04, 2016

Re: Chevron Service Station No. 90076  
4265 Foothill Boulevard  
Oakland, CA

I have reviewed the attached report titled *Response to Regulatory Letter*.

I agree with the conclusions and recommendations presented in the referenced report. The information in this report is accurate to the best of my knowledge and all local Agency/Regional Board guidelines have been followed. This report was prepared by GHD Services Inc, upon whose assistance and advice I have relied.

This letter is submitted pursuant to the requirements of California Water Code Section 13267(b)(1) and the regulating implementation entitled Appendix A pertaining thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge.

Sincerely,

A handwritten signature in blue ink that reads "Mark E. Horne".

Mark Horne  
Project Manager

Attachment: *Response to Regulatory Letter*

October 3, 2016

Reference No. 311977

Mr. Mark Detterman  
Alameda County Environmental Health Services  
1131 Harbor Bay Parkway, Suite 250  
Alameda, California 94502-6577

**Re: Response to July 26, 2016 Regulatory Letter  
Chevron Service Station 90076  
4265 Foothill Boulevard  
Oakland, California  
Fuel Leak Case No. RO0000427**

Dear Mr. Detterman:

GHD Services Inc. (GHD) is submitting this Response to July 26, 2016 Regulatory Letter for the site referenced above (Figures 1 and 2) on behalf of Chevron Environmental Management Company (Chevron). In a July 26, 2016 letter, Alameda County Environmental Health (ACEH) requested Chevron address several technical comments (Attachment A). ACEH's comments are reproduced below in italics, followed by GHD's responses.

## 1. Technical Comment Response

### [LTCP Media Specific Criteria for Groundwater](#)

**Length of Groundwater Plume** – *The length of the shallow groundwater plume has not been defined by the existing offsite downgradient monitoring well network that monitor one of two groundwater bearing zones in the site vicinity. Contaminant concentrations in downgradient groundwater well C-11, the furthest downgradient well monitoring the shallow groundwater zone remain above water quality objectives. The shallow water-bearing zone has also not been defined laterally to the north or south of well C-11. This appears to be an important step due to multiple basements in the vicinity.*

*Downgradient groundwater wells C-7 and C-9 monitor a deeper groundwater bearing zone; these wells appear to define the length of the deeper groundwater bearing zone.*

*Therefore as an initial step, it appears reasonable to request the generation of an additional line of evidence to estimate the plume length of the shallow water-bearing zone. This is requested to be done using Table 1 of the LTCP technical justification paper entitled Technical Justification for Groundwater Media-Specific Criteria (April 2012) and plotting the maximum plume length for methyl tert butyl ether (MTBE). This is requested to be combined with an evaluation of the potential for sensitive receptors, including dewater structures such as basements with sumps to be present within the estimated plume length.*

*It also appears reasonable to attempt to define the lateral extent of the shallow groundwater hydrocarbon plume in order to determine the potential for vapor intrusion in to the three residential basements that may be within the downgradient groundwater plume.*

As illustrated in the well construction Table 1, wells C-6 through C-9 are screened in a deeper zone within the shallow aquifer. Therefore, beginning in 2013, these wells were not included in the groundwater flow calculations. A rose diagram depicting the groundwater flow from 2013 through 2016 is included on Figure 2. Groundwater flow fluctuated between northwest and southwest, which is consistent with data from the Former BP Station #11109 located across Foothill Boulevard (Geotracker No. T0600100217) and the Former Shell #13-5686 (Geotracker No. T0600101065) located across High Street.

Well C-6 and boring C-12 define hydrocarbons laterally to the north of C-11 along Bond Street. In February 2015, boring C-12 was advanced with the intention of installing a shallow screened monitoring well; however, no groundwater was encountered down to 30 feet below grade (fbg), therefore no well was installed and the boring was backfilled. No hydrocarbons were detected in soil samples collected between 3 and 30 fbg from C-12. Additionally, no dissolved benzene, toluene, ethylbenzene, and xylenes (BTEX) has been detected in well C-6 since 2014 and total petroleum hydrocarbon as gasoline (TPHg) concentrations have fluctuated, between the reporting limit (< 50 micrograms per liter ( $\mu\text{g}/\text{L}$ )) and 180 mg/L, since 2014. It does not appear prudent to install a shallow well south of C-11 along Bond Street as this location would be directly downgradient of a former Shell Station and would therefore likely monitor dissolved hydrocarbons migrating from the former Shell site (Geotracker No. T0600101065). TPHg, benzene, and methyl tertiary butyl ether (MTBE) concentrations in groundwater are illustrated on Figures 3, 4, and 5.

Wells C-6 through C-9 are screened deeper than other site wells. Groundwater data from wells C-8 and C-9 vertically define dissolved hydrocarbons downgradient of the site. Geologic cross sections are included as Figures 6 and 7. Well construction details are included as Table 1 and historical groundwater monitoring and sampling data are included as Table 2.

The extent of dissolved MTBE is laterally defined by wells C-5 (west), C-10 (east), and C-11 (south) and vertically defined downgradient by wells C-6 through C-9 (Figure 5 and Table 2). The estimated plume lengths for TPHg and benzene using Table 1 of the technical justification paper are included as Figures 8 and 9.

Based on the lack of hydrocarbons in soil from boring C-12 and no dissolved BTEX detected in well C-6 since 2014, both located between the site and the building at 1715 High Street (Figure 2), there does not appear to be an exposure risk to the occupants of the apartment building. No potential receptors are located south of the site and well C-11; only a large parking lot and a building without a basement, housing a supermarket.

- a. **Water Supply Wells** – *The report states that a water supply well survey was conducted in 2015 by GHD using Department of Water Resources (DWR) and Alameda County Public Works Agency (ACPWA) databases. ACEH has not been able to locate the survey in either the ACEH or Geotracker databases. Please forward a copy of the report in order for the public record to be complete.*

The 2015 water supply well survey conducted by GHD was reported in GHD's June 3, 2016 Site Assessment Report and Updated Focused Site Conceptual Model. In 2015, GHD contacted DWR and ACPWA regarding wells within 2,000 feet of the site. Sixty-two wells were identified in the search area. Of these, one was a cathodic protection well; one was identified as an irrigation well, and one of unknown use and location. Of the remaining wells, 51 were identified as monitoring wells, 3 as test wells, 2 as soil vapor probes, 2 as borings, and 1 as an observation well. The irrigation well was reportedly located approximately 1,600 feet west-northwest of the site (crossgradient). No domestic or municipal water supply wells were identified within the search area. A water supply well table is included as Table 3 and the water supply well location map is included as Figure 10.

- b. **Concentration Stability** – *Dissolved phase concentrations in wells C-2 and C-4 fluctuate annually between March and September. Concentrations are highest in March when depth of groundwater measurements indicates groundwater is the shallowest. This indicates shallow residual soil contamination is present at the site. Concentrations of TPHg have recently ranged between 6,100 and 14,000 micrograms per liter (mg/L) and concentrations of benzene have ranged between 490 and 910 mg/L in wells C-2 and C-4, downgradient of the shallow residual soil sources that may be related to product line releases.*

Dissolved TPHg and benzene concentrations in wells C-2 and C-4 fluctuate with groundwater depth fluctuations; however, concentrations are decreasing overall. TPHg concentrations are currently three orders of magnitude lower than historical high concentrations in C-2 and one order of magnitude lower in C-4. Benzene concentrations are currently two orders of magnitude lower than the historical high concentrations in both wells. Table 1.1 below summarizes the historical maximum and current concentrations in wells C-2 and C-4. Historical groundwater monitoring and sampling data are included in Table 2. Trend graphs illustrating the downward trends are included in Attachment B.

Table 1.1 Summary of Degradation Calculations – C-2 and C-4

Well	Analyte	Maximum Concentration	Current Concentration	Date to Reach Water Quality Objective
C-2	TPHg	1,100,000	9,700	2054
	Benzene	30,000	540	2024
	MTBE	5,200	37	2020
C-4	TPHg	48,000	6,300	2110
	Benzene	14,000	910	2095
	MTBE	4,600	9	2019

GHD is not preparing a data gap work plan to address the ACEH items above. Alternatively, discussed below is justification as to why the site satisfies the LTCP media-specific criteria for groundwater

The Policy requires that water quality objectives (WQOs) will be attained through natural attenuation within a reasonable amount of time, the contaminant plume that exceeds WQOs is stable or decreasing in areal extent, and meets the additional characteristics of one of the five classes of sites listed in the Policy.

The five classes of sites are stated in the Policy as follows:

1. The contaminant plume that exceeds WQOs is less than 100 feet in length.
  - a. There is no free product.
  - b. The nearest existing water supply well and/or surface water body is greater than 250 feet from the defined plume boundary.
2. The contaminant plume that exceeds WQOs is less than 250 feet in length.
  - a. There is no free product.
  - b. The nearest existing water supply well and/or surface water body is greater than 1,000 feet from the defined plume boundary.
  - c. The dissolved concentration of benzene is less than 3,000 µg/l and the dissolved concentration of MTBE is less than 1,000 µg/l.
3. The contaminant plume that exceeds WQOs is less than 250 feet in length.
  - a. Free product may be present below the site but does not extend off-site.
  - b. The plume has been stable or decreasing for a minimum of 5 years.
  - c. The nearest existing water supply well and/or surface water body is greater than 1,000 feet from the defined plume boundary.
  - d. The property owner is willing to accept a deed restriction if the regulatory agency requires a deed restriction as a condition of closure.

4. The contaminant plume that exceeds WQOs is less than 1,000 feet in length.
  - a. There is no free product.
  - b. The nearest existing water supply well and/or surface water body is greater than 1,000 feet from the defined plume boundary.
  - c. The dissolved concentration of benzene is less than 1,000 µg/l and the dissolved concentration of MTBE is less than 1,000 µg/l.
5. An analysis of site specific conditions determines that the site under current and reasonable anticipated near-term future scenarios poses a low threat to human health and safety and to the environment and water quality objectives will be achieved within a reasonable time frame.

The site satisfies Class 4 criteria as follows:

- The dissolved hydrocarbon plume that exceeds WQOs is less 1,000 feet in length from the source area (former dispenser islands near C-A and C-2) (Figures 3, 4, and 5). Downgradient well C-11 is approximately 300 feet from the source area.
- No LNAPL has been observed in any monitoring wells.
- The nearest identified well is an irrigation well approximately 1,600 feet west-northwest of the site (Figure 10).
- The nearest surface water bodies are a remaining day-lighted portion of Courtland Creek approximately 1,500 feet to the northeast and a remaining day-lighted portion of Peralta Creek approximately 3,700 feet northwest and a tidal canal that feeds into the San Leandro Bay is approximately 1 mile southwest of the site.
- Dissolved benzene and MTBE concentrations are below the 1,000 mg/L threshold requirement. During the first quarter 2016 sampling event the highest benzene concentrations detected was 910 mg/L and the highest MTBE concentration was 290 mg/L (Figures 4 and 5).

#### [LTCP Media Specific Criteria for Vapor Intrusion and Indoor Air](#)

Prior to proposing a data gap work plan for vapor intrusion to indoor air, GHD recommends obtaining information regarding the supposed basements beneath the apartment building at 1715 High Street, the residential building at 1718 High Street, the adjacent residential building at 1723 High Street, and the crawl space beneath the apartment building on the northwest side (4237 Foothill Boulevard) of the site (Figure 2). This information is essential to propose appropriate additional vapor intrusion assessment and potentially additional downgradient monitoring wells.

ACEH also raises concern about the methane percentage detected in vapor probe VP-5, located on the northwest side of the site adjacent to the apartment building with the crawl space (4237 Foothill Boulevard).

*Proposed Regulatory Framework for Evaluating the Methane Hazard due to Vapor Intrusion*, Bart Eklund, 2010 Air and Waste Management Association Conference is used as a reference for much of the below discussion.

Although methane (CH<sub>4</sub>) concentrations were detected above the lower explosive limit (LEL) of 5%, CH<sub>4</sub> is not flammable directly within a typical soil matrix for several reasons; a) there is typically insufficient oxygen in soil where CH<sub>4</sub> is detected at or above the flammable range; b) soil matrix is not a confined space such as a confined underground space with little to no ventilation where CH<sub>4</sub> can accumulate and mix with oxygen to start a fire with an ignition source; and c) soil has pore space diameters that are smaller than what is called a quenching distance and therefore a flame cannot propagate - for soils, the minimum quenching distance is documented to be 1.14 mm for CH<sub>4</sub>. That means for CH<sub>4</sub> to start and sustain a fire in the soil, the soils have to be very permeable to have a pore diameter of at least 1.14 mm. This scenario is unlikely given the top 10 feet below the surface consists primarily of fine grained silts and clays (Figures 6 and 7).

The primary concern with CH<sub>4</sub> is its flammability in air (that is, in buildings and other confined spaces). CH<sub>4</sub> in soil gas is of concern only if it migrates into enclosed spaces and mixes with oxygen to form a mixture within or above the flammable range 5-15%. As mentioned above, CH<sub>4</sub> is not flammable within a typical soil matrix.

Migration of CH<sub>4</sub> from soil gas into buildings can occur through two mechanisms: advection and diffusion. Advection transport has been associated with CH<sub>4</sub> incidents (e.g., fire or explosion), whereas no examples are known for CH<sub>4</sub> incidents resulting from diffusive transport alone. Diffusion also occurs but at rates too low to result in unacceptable indoor air concentrations under reasonably likely scenarios. Therefore, diffusion is not considered a key transport mechanism when evaluating CH<sub>4</sub> hazard.

Buildings typically have an air exchange rate of 0.5-1 times/hour (i.e. the building air is refreshed by mixing with outdoor air 12-24 times a day) and so a relatively high rate of CH<sub>4</sub> vapor intrusion is necessary for the indoor atmosphere to approach the lower flammability limit for CH<sub>4</sub> of 5%. So, a large advective flow from subsurface to indoor air is necessary to potentially raise the CH<sub>4</sub> level in indoor air to the flammability range for CH<sub>4</sub>.

In general, the greater the area of soil gas with an elevated methane percentage, the greater the potential for vapor intrusion of methane to be an issue. A single, isolated spot of 5-8% (VP-5) of CH<sub>4</sub> is unlikely to result in an indoor issue because there is not a great enough volume of CH<sub>4</sub> gas to be transported by advection into the crawl space to counteract ventilation under normal building conditions, which is the case for the crawl space beneath the subject building. Vapor probe VP-6, also located adjacent to the apartment building, contained a maximum of 0.0035 % CH<sub>4</sub>. Given the condition of the subject building with a ventilated crawl space, it is unlikely that pressure differential or the volume of CH<sub>4</sub> flow will be large enough to cause CH<sub>4</sub> in indoor air within the flammable range.

## LTCP Media Specific Criteria for Direct Contact and Outdoor Air Criteria

*Our review of the case files indicates that insufficient data collection and analysis has been presented to satisfy the media-specific criteria for direct contact and outdoor air exposure. Specifically, elevated residual concentrations of benzene which do not meet the LTCP criteria for commercial or utility worker direct contact exposure appear to remain in the vicinity of well C-2. Ethylbenzene and naphthalene were not included in the soil analysis at that time. While ACEH recognizes the data is older and may ultimately meet the criteria, confirmation samples have not been collected to verify this presumption.*

In 1987, the soil sample collected at 9 fbg during the installation of well C-2 contained 16 mg/kg benzene which exceeds the LTCP criteria for commercial and utility worker exposure. Ethylbenzene and naphthalene were not analyzed. While confirmation samples were not collected at the same location as existing C-2 in 2015, soil borings B-1 through B-4 were advanced at the locations of the two former dispenser islands (source area) immediately upgradient of C-2. Soil samples were collected at 3, 8, and 10 fbg from each boring, for a total of 12 samples. The highest concentrations detected in the samples were 0.24 mg/kg benzene, 5.1 mg/kg ethylbenzene, and 5.1 mg/kg naphthalene. These concentrations are below the residential, commercial, and utility worker scenarios for direct contact and outdoor air. Because these concentrations were detected in the source area upgradient of well C-2, it can be assumed 28 years later, hydrocarbon concentrations in soil in the area of C-2 are now in the same order of magnitude as those detected in the source area since removal of the dispenser islands and product lines in the 1980s.

Additionally, 44 soil samples have been collected across the site between 0 and 10 fbg. Of these samples only 2 exceed the LTCP criteria for commercial and utility workers; 33 mg/kg benzene from C-A at 8.5 fbg and 16 mg/kg benzene from C-2 at 9 fbg, collected in 1987. However, the 95 percent upper confidence level of 2.9 mg/kg for the sample group is below the commercial LTCP criteria. No ethylbenzene or naphthalene concentrations exceed the residential or commercial LTCP criteria. Cumulative soil data table is included as Table 4.

Based on the above justification, the site satisfies the LTCP media-specific criteria for direct contact and outdoor air exposure, and therefore no data gap work plan has been prepared.

## Groundwater Monitoring

*Groundwater monitoring of offsite wells C-7 and C-9 has not been conducted since September 2014 due to the lack of an access agreement with the offsite property owners. ACEH request that an access agreement be initiated with the property owner in order to monitor the wells a minimum of one time before closure, and for the purpose if well destruction prior to closure.*

Chevron and GHD have been working to obtain access to the offsite property where wells C-7 and C-9 are located. Below is a timeline of the attempts to date.

- 8.6.2014: AA package mailed to property owner.
- 9-8-2014: 2nd AA package mailed to property owner.
- 10.1.2014: No response from property owner.
- 10.30.2014: GHD calls and leaves message for property owner Michael Mugel.
- 11.6.2014: Receive email from property owner representative requesting additional information - further define work, term of agreement, regular reports sent, add Red Mountain Group as additional insured on insurance.
- 12.15.2014: Submitted additional insured along with semi-annual reports and copy of access agreement package.
- 1.7.2015: GHD sends response to Red Mountain Group.
- 2.18.2015: GHD to replies to Red Mountain Group's email.
- 8.17.2015: No response from property owner regarding agreement.
- 9.2.2015: GHD emails property owner.
- 4.27.2016: Property owner sent email stating that document is with attorney for review.
- 7.22.2016: GHD to follow up with attorney; no response from owner to date.

#### **Data Gap Investigation Work Plan and Focused Site Conceptual Model**

GHD submitted a focused site conceptual model on June 3, 2016 following the February 2016 soil boring and well installation. Prior to completing an additional Focused Site Conceptual Model with a Data Gap Investigation Work Plan, GHD recommends obtaining information regarding the supposed basements beneath the apartment building at 1715 High Street, the residential building at 1718 High Street, and the residential building at 1723 High Street, and the crawl space beneath the apartment building at 4237 Foothill Boulevard on the northwest side of the site. Information on these basements, possible sumps, and the crawl space are crucial to fully understand the potential exposure scenarios and therefore propose appropriate additional assessments.

## **2. Closing**

GHD will proceed with contacting the property owners of the 1715 High Street, 171 High Street, 1723 High Street, and 4237 Foothill Boulevard to obtain information on the basements and crawl space constructions and possible sumps. GHD and Chevron will also continue to work with the offsite property owner to obtain access for sampling, and eventually destroying wells C-7 and C-9.

GHD will keep ACEH updated on the status of obtaining the basement and crawl space constructions. Once the required information is received, GHD will complete and submit a Data Gap Work Plan and Focused Site Conceptual Model.

Please contact Kiersten Hoey at (510) 420-3347 if you have any questions or require additional information.

Cordially,

GHD

		Units	ft	ft	ft-amsl	ft														

**Abbreviations and Notes:**

TOC = Top of casing

DTW = Depth to water

GWE = Groundwater elevation

(ft-amsl) = Feet above mean sea level

ft = Feet

µg/L = Micrograms per liter

TPH-GRO = Total petroleum hydrocarbons - gasoline range organics

VOCs = Volatile Organic Compounds

B = Benzene

T = Toluene

E = Ethylbenzene

X = Xylene

MTBE = Methyl tert-butyl ether

-- = Not available or not applicable

&lt;x = Not detected above laboratory method detection limit

J = Estimated value between method detection limit and laboratory reporting limit

\* TOC elevation for C-10 was surveyed on September 26, 2003, by Virgil Chavez Land Surveying. The benchmark for this survey was a City of Oakland No. 1589, a cut

**TABLE 2**  
**GROUNDWATER MONITORING AND SAMPLING DATA**  
**CHEVRON SERVICE STATION 90076**  
**4265 FOOTHILL BOULEVARD, OAKALND, CALIFORNIA**

Location	Date	TOC	DTW	GWE	LNAPL <sup>**</sup>	LNAPL REMOVED	HYDROCARBONS		PRIMARY VOCs				ADDITIONAL VOCs		FIELD PARAMETERS			GENERAL CHEMISTRY

square in the sidewalk at the mid-return at the west corner of High Street and Foothill Blvd., (Benchmark Elevation = 38.54 feet, NGVD 29).

- \*\* GWE corrected for the presence of LNAPL; correction factor: [(TOC - DTW) + (LNAPL x 0.80)].
- 1 Confirmation run.
- 2 Sample was analyzed past hold-time, the results should be considered as estimated.
- 3 ORC present in well.
- 4 Laboratory report indicates gasoline C6-C12.
- 5 Laboratory report indicates sample was originally analyzed within holding time. Re-analysis for confirmation or dilution was performed past the recommended holding time.
- 6 Laboratory report indicates hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
- 7 BTEX and MTBE by EPA Method 8260.
- 8 Well development performed.
- 9 ORC removed from well.
- 10 TOC has been altered; unable to determine an accurate GWE.
- 11 Laboratory confirmed result.
- 12 Sampled annually.
- 13 Inaccessible
- 14 Analyzed in part per billion (ppb)
- 15 Sampled semi-annually

Subject: Data Gap Work Plan Request; Fuel Leak Case No. RO0000427 and GeoTracker Global ID T0600100339, Chevron #9-0076, 4265 Foothill Blvd, Oakland, CA 94601

Dear Mr. Horne and Mr. and Ms. Le:

Alameda County Department of Environmental Health (ACDEH) staff has reviewed the case file for the above referenced site including the *First Quarter 2016 Groundwater Monitoring and Sampling Report*, dated May 6, 2016, and the *Site Investigation Report and Updated Focused Site Conceptual Model*, dated June 3, 2016. These documents were prepared and submitted on your behalf by GHD Services, Inc (GHD). Thank you for submitting the documents, they have moved the site forward, and allow a narrower focusing of future investigations.

ACDEH has re-evaluated site data and recommendations presented in the above-mentioned reports, in conjunction with the case files, and the State Water Resources Control Board's (SWRCBs) Low Threat Underground Storage Tank Case Closure Policy (LTCP). Based on ACDEH staff review, we have determined that the site now additionally meets the LTCP General Criteria e (Site Conceptual Model), and f (Secondary Source Removal). The site does not meet the LTCP Media-Specific Criteria for Groundwater, the Media-Specific Criteria for Vapor Intrusion to Indoor Air, and the Media-Specific Criteria for Direct Contact and Outdoor Air (See Geotracker for the updated LTCP checklist).

Based on ACEH staff review of the case file, we request that you address the following technical comments and send us the reports described below.

**TECHNICAL COMMENTS**

1. **LTCP Media Specific Criteria for Groundwater** – To satisfy the media-specific criteria for groundwater, the contaminant plume that exceeds water quality objectives must be stable or decreasing in areal extent, and meet all of the additional characteristics of one of the five classes of sites listed in the policy.

Our review of the case files indicates that insufficient data and analysis has been presented to support the requisite characteristics of plume stability, plume length, stable benzene concentrations, or that the property owner may be willing to accept a land use restriction. This analysis considered the following site specific data:

- a. **Length of Groundwater Plume** – The length of the shallow groundwater plume has not been defined by the existing offsite downgradient monitoring well network that monitor one of two groundwater bearing zones in the site vicinity. Contaminant concentrations in downgradient groundwater well C-11, the furthest downgradient well monitoring the shallow groundwater zone, remain above water quality objectives. The shallow water-bearing zone has also not been defined laterally to the north or south of well C-11. This appears to be an important step due to multiple basements in the vicinity.

Downgradient groundwater wells C-7 and C-9 monitor a deeper groundwater bearing zone; these wells appear to define the length of the deeper groundwater bearing zone.

Therefore, as an initial step, it appears reasonable to request the generation of an additional line of evidence to estimate the plume length of the shallow water-bearing zone. This is requested to be done using Table 1 of the LTCP technical justification paper entitled *Technical Justification for Groundwater Media-Specific Criteria* (April 2012) and plotting the maximum plume length for methyl tert butyl ether (MTBE). This is requested to be combined with an evaluation of the potential for sensitive receptors, including dewatering structures such as basements with sumps, to be present within the estimated plume length.

It also appears reasonable to attempt to define the lateral extent of the shallow groundwater hydrocarbon plume in order to determine the potential for vapor intrusion in to the three residential basements that may be within the downgradient groundwater plume.

- b. **Water Supply Wells** – The referenced report states that a water supply well survey was conducted in 2015 by GHD using Department of Water Resources (DWR) and Alameda County Public Works Agency (ACPWA) databases. ACDEH has not been able to locate the survey in either the ACDEH or Geotracker databases. Please forward a copy of the report in order for the public record to be complete.
- c. **Concentration Stability** – Dissolved phase concentrations in wells C-2 and C-4 fluctuate annually between March and September. Concentrations are highest in March when depth to groundwater measurements indicates groundwater is the shallowest. This indicates shallow residual soil contamination is present at the site. Concentrations of Total Petroleum Hydrocarbons as gasoline (TPHg) have recently ranged between 6,100 and 14,000 micrograms per liter ( $\mu\text{g/l}$ ) and concentrations of benzene have ranged between 490 and 910  $\mu\text{g/l}$  in wells C-2 and C-4, downgradient of the shallow residual soil sources that may be related to product line releases.

Please present a strategy in the Data Gap Work Plan requested in Technical Comment 5 below to address the items discussed above. Alternatively, please provide justification of why the site satisfies the Media-Specific Criteria for Groundwater in the focused SCM described in Technical Comment 5 below.

- 2. **LTCP Media Specific Criteria for Vapor Intrusion to Indoor Air** – The LTCP describes conditions, including bioattenuation zones, which if met will assure that exposure to petroleum vapors in indoor air will not pose unacceptable health risks to human occupants of existing or future site buildings, and adjacent parcels. Appendices 1 through 4 of the LTCP criteria illustrate four potential exposure scenarios and describe characteristics and criteria associated with each scenario.

Our review of the case files indicates that although the site is an active service station, there are two residential houses and one multiunit apartment building each with basements in the immediate vicinity of the site, within or immediately adjacent to the mapped extent of the shallow groundwater plume. As indicated above, ACDEH does not consider the lateral extent of the shallow groundwater plume to be sufficiently defined to eliminate the concern that these basements may be at risk of vapor intrusion from the groundwater contamination plume.

Presuming a standard basement depth of eight to nine feet below grade surface (bgs), the LTCP indicates a vapor sample is to be collected at a depth of approximately 13 to 14 feet bgs (or in other words five feet below the foundation depth). The bore logs for wells C-4, C-6, and B-7 document hydrocarbon contamination as shallow as 6.5 to 8 feet (C-4 and B-7), to approximately 18.5 feet (C-6). As stated in previous directive letters, at least seasonal unmonitored contaminated groundwater appears to be present as shallow as 6 to 8 feet bgs (see logs for B-7, VP-3, and the presence of water in VP-2 tube during the February 2015 vapor sampling event), and it appears hydrocarbon migration in this shallow zone may be capable of at least seasonally affecting the basements. One

time vapor sampling events at vapor locations VP-1, VP-2, and VP-4, and two time events at VP-3 and VP-6 appear to meet the LTCP Scenario 4a or Scenario 4b, but lacking the construction details for the adjacent basement it cannot be determined if the basement is at risk from vapor intrusion from all or deeper sources. Additionally, Department of Toxic Substances Control (DTSC) guidance indicates multiple vapor sampling is appropriate in order to assess temporal and seasonal variations in soil gas concentrations.

Repeat vapor sampling at VP-5 has provided conflicting data, as the location has met and has not meet one of the LTCP Scenarios. Additionally, methane concentrations consistently have been detected above the Lower Explosive Limit (LEL) for methane of 5%. It therefore appears reasonable to request additional details on the crawl space beneath the multiunit apartment building, including the location of vents, building floor construction materials, as well as a crawl space vapor sample. While ACDEH understands that a crawl space can allow ventilation of soil vapors, the DTSC considers crawl space vapor to be representative of indoor air, (thus does not undergo attenuation between the crawl space and indoor air). The potentially explosive methane level at the location is an additional concern for the apartment building.

Therefore, please present a strategy in the Data Gap Investigation Work Plan requested in Technical Comment 5 below to collect additional data to satisfy the bioattenuation zone characteristics of Scenarios 1, 2 or 3, or to collect soil gas data to satisfy Scenario 4.

3. **LTCP Media Specific Criteria for Direct Contact and Outdoor Air Criteria** – The LTCP describes conditions where direct contact with contaminated soil or inhalation of contaminants volatized to outdoor air poses a low threat to human health. According to the policy, release sites where human exposure may occur satisfy the media-specific criteria for direct contact and outdoor air exposure and shall be considered low-threat if the maximum concentrations of petroleum constituents in soil are less than or equal to those listed in Table 1 for the specified depth bgs. Alternatively, the policy allows for a site specific risk assessment that demonstrates that maximum concentrations of petroleum constituents in soil will have no significant risk of adversely affecting human health, or controlling exposure through the use of mitigation measures, or institutional or engineering controls.

Our review of the case files indicates that insufficient data collection and analysis has been presented to satisfy the media-specific criteria for direct contact and outdoor air exposure. Specifically, elevated residual concentrations of benzene which do not meet the LTCP criteria for commercial or utility worker direct contact exposure appear to remain in the vicinity of well C-2. Ethylbenzene and naphthalene were not included in the soil analysis at the time. While ACDEH recognizes the data is older and may ultimately meet the criteria, confirmation samples have not been collected to verify this presumption.

Therefore, please present a strategy in the Data Gap Work Plan requested in Technical Comment 5 below to collect sufficient data to satisfy the direct contact and outdoor air exposure criteria at the site.

Alternatively, please provide justification of why the site satisfies the Media-Specific Criteria for Direct Contact and Outdoor Air Exposure in the focused SCM requested in Technical Comment 5 below that assures that exposure to petroleum constituents in soil will have no significant risk of adversely affecting human health.

4. **Groundwater Monitoring** – Groundwater monitoring of offsite wells C-7 and C-9 has not been conducted since September 2014 due to the lack of an access agreement with the offsite property owner. ACDEH requests that an access agreement be initiated with the property owner in order to monitor the wells a minimum of one time before closure, and for the purpose of well destruction prior to closure.
5. **Data Gap Investigation Work Plan and Focused Site Conceptual Model** – Please prepare a Data Gap Investigation Work Plan to address the technical comments listed above. Please support the scope of work in the Data Gap Investigation Work Plan with a focused SCM and Data Quality

Objectives (DQOs) that relate the data collection to each LTCP criteria. For example please clarify which scenario within each Media-Specific Criteria a sampling strategy is intended to apply to.

In order to expedite review, ACDEH requests the focused SCM be presented in a tabular format that highlights the major SCM elements and associated data gaps, which need to be addressed to progress the site to case closure under the LTCP. Please see Attachment A "Site Conceptual Model Requisite Elements". Please sequence activities in the proposed revised data gap investigation scope of work to enable efficient data collection in the fewest mobilizations possible.

#### TECHNICAL REPORT REQUEST

Please upload technical reports to the ACDEH ftp site (Attention: Mark Detterman), and to the State Water Resources Control Board's Geotracker website, in accordance with the following specified file naming convention, and in Attachment 1, and schedule:

- **October 3, 2016 – Data Gap Work Plan**  
File to be named RO427\_WP\_R\_YYYY-mm-dd

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

Online case files are available for review at the following website: <http://www.acgov.org/aceh/index.htm>.

If your email address does not appear on the cover page of this notification, ACDEH is requesting you provide your email address so that we can correspond with you quickly and efficiently regarding your case.

Should you have any questions, please contact me at (510) 567-6876 or send me an electronic mail message at [mark.detterman@acgov.org](mailto:mark.detterman@acgov.org).

Sincerely,

Digitally signed by Mark Detterman

**Responsible Party(ies) Legal Requirements / Obligations**

**REPORT REQUESTS**

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

**ELECTRONIC SUBMITTAL OF REPORTS**

ACEH's Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of reports in electronic form. The electronic copy replaces paper copies and is expected to be used for all public information requests, regulatory review, and compliance/enforcement activities. Instructions for submission of electronic documents to the Alameda County Environmental Cleanup Oversight Program FTP site are provided on the attached "Electronic Report Upload Instructions." Submission of reports to the Alameda County FTP site is an addition to existing requirements for electronic submittal of information to the State Water Resources Control Board (SWRCB) GeoTracker website. In September 2004, the SWRCB adopted regulations that require electronic submittal of information for all groundwater cleanup programs. For several years, responsible parties for cleanup of leaks from underground storage tanks (USTs) have been required to submit groundwater analytical data, surveyed locations of monitoring wells, and other data to the GeoTracker database over the Internet. Beginning July 1, 2005, these same reporting requirements were added to Spills, Leaks, Investigations, and Cleanup (SLIC) sites. Beginning July 1, 2005, electronic submittal of a complete copy of all reports for all sites is required in GeoTracker (in PDF format). Please visit the SWRCB website for more information on these requirements ([http://www.waterboards.ca.gov/water\\_issues/programs/ust/electronic\\_submittal/](http://www.waterboards.ca.gov/water_issues/programs/ust/electronic_submittal/)).

**PERJURY STATEMENT**

All work plans, technical reports, or technical documents submitted to ACEH must be accompanied by a cover letter from the responsible party that states, at a minimum, the following: "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report is true and correct to the best of my knowledge." This letter must be signed by an officer or legally authorized representative of your company. Please include a cover letter satisfying these requirements with all future reports and technical documents submitted for this fuel leak case.

**PROFESSIONAL CERTIFICATION & CONCLUSIONS/RECOMMENDATIONS**

The California Business and Professions Code (Sections 6735, 6835, and 7835.1) requires that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments be performed under the direction of an appropriately registered or certified professional. For your submittal to be considered a valid technical report, you are to present site specific data, data interpretations, and recommendations prepared by an appropriately licensed professional and include the professional registration stamp, signature, and statement of professional certification. Please ensure all that all technical reports submitted for this fuel leak case meet this requirement.

**UNDERGROUND STORAGE TANK CLEANUP FUND**

Please note that delays in investigation, later reports, or enforcement actions may result in your becoming ineligible to receive grant money from the state's Underground Storage Tank Cleanup Fund (Senate Bill 2004) to reimburse you for the cost of cleanup.

**AGENCY OVERSIGHT**

If it appears as though significant delays are occurring or reports are not submitted as requested, we will consider referring your case to the Regional Board or other appropriate agency, including the County District Attorney, for possible enforcement actions. California Health and Safety Code, Section 25299.76 authorizes enforcement including administrative action or monetary penalties of up to \$10,000 per day for each day of violation.

<b>Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC)</b>	<b>REVISION DATE:</b> May 15, 2014 <b>ISSUE DATE:</b> July 5, 2005 <b>PREVIOUS REVISIONS:</b> October 31, 2005; December 16, 2005; March 27, 2009; July 8, 2010, July 25, 2010
<b>SECTION:</b> Miscellaneous Administrative Topics & Procedures	<b>SUBJECT:</b> Electronic Report Upload (ftp) Instructions

The Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of all reports in electronic form to the county's ftp site. Paper copies of reports will no longer be accepted. The electronic copy replaces the paper copy and will be used for all public information requests, regulatory review, and compliance/enforcement activities.

## REQUIREMENTS

- Please do not submit reports as attachments to electronic mail.
- Entire report including cover letter must be submitted to the ftp site as a single portable document format (PDF) with no password protection.
- It is preferable that reports be converted to PDF format from their original format, (e.g., Microsoft Word) rather than scanned.
- Signature pages and perjury statements must be included and have either original or electronic signature.
- Do not password protect the document. Once indexed and inserted into the correct electronic case file, the document will be secured in compliance with the County's current security standards and a password. Documents with password protection will not be accepted.
- Each page in the PDF document should be rotated in the direction that will make it easiest to read on a computer monitor.
- Reports must be named and saved using the following naming convention:

RO#\_Report Name\_Year-Month-Date (e.g., RO#5555\_WorkPlan\_2005-06-14)

## Submission Instructions

- 1) Obtain User Name and Password
  - a) Contact the Alameda County Environmental Health Department to obtain a User Name and Password to upload files to the ftp site.
    - i) Send an e-mail to [deh.loptoxic@acgov.org](mailto:deh.loptoxic@acgov.org)
  - b) In the subject line of your request, be sure to include "ftp PASSWORD REQUEST" and in the body of your request, include the **Contact Information, Site Addresses, and the Case Numbers (RO# available in Geotracker)** you will be posting for.
- 2) Upload Files to the ftp Site
  - a) Using Internet Explorer (IE4+), go to <ftp://alcoftp1.acgov.org>
    - (i) Note: Netscape, Safari, and Firefox browsers will not open the FTP site as they are NOT being supported at this time.
  - b) Click on Page located on the Command bar on upper right side of window, and then scroll down to Open FTP Site in Windows Explorer.
  - c) Enter your User Name and Password. (Note: Both are Case Sensitive.)
  - d) Open "My Computer" on your computer and navigate to the file(s) you wish to upload to the ftp site.
  - e) With both "My Computer" and the ftp site open in separate windows, drag and drop the file(s) from "My Computer" to the ftp window.
- 3) Send E-mail Notifications to the Environmental Cleanup Oversight Programs
  - a) Send email to [deh.loptoxic@acgov.org](mailto:deh.loptoxic@acgov.org) notify us that you have placed a report on our ftp site.
  - b) Copy your Caseworker on the e-mail. Your Caseworker's e-mail address is the entire first name then a period and entire last name @acgov.org. (e.g., firstname.lastname@acgov.org)
  - c) The subject line of the e-mail must start with the RO# followed by **Report Upload**. (e.g., Subject: RO1234 Report Upload) If site is a new case without an RO#, use the street address instead.
  - d) If your document meets the above requirements and you follow the submission instructions, you will receive a notification by email indicating that your document was successfully uploaded to the ftp site.

**ATTACHMENT A**

**Site Conceptual Model Requisite Elements**

## ATTACHMENT A

### Site Conceptual Model

The site conceptual model (SCM) is an essential decision-making and communication tool for all interested parties during the site characterization, remediation planning and implementation, and closure process. A SCM is a set of working hypotheses pertaining to all aspects of the contaminant release, including site geology, hydrogeology, release history, residual and dissolved contamination, attenuation mechanisms, pathways to nearby receptors, and likely magnitude of potential impacts to receptors.

The SCM is initially used to characterize the site and identify data gaps. As the investigation proceeds and the data gaps are filled, the working hypotheses are modified, and the overall SCM is refined and strengthened until it is said to be "validated". At this point, the focus of the SCM shifts from site characterization towards remedial technology evaluation and selection, and later remedy optimization, and forms the foundation for developing the most cost-effective corrective action plan to protect existing and potential receptors.

For ease of review, Alameda County Environmental Health (ACEH) requests utilization of tabular formats to (1) highlight the major SCM elements and their associated data gaps which need to be addressed to progress the site to case closure (see Table 1 of attached example), and (2) highlight the identified data gaps and proposed investigation activities (see Table 2 of the attached example). ACEH requests that the tables presenting the SCM elements, data gaps, and proposed investigation activities be updated as appropriate at each stage of the project and submitted with work plans, feasibility studies, corrective action plans, and requests for closures to support proposed work, conclusions, and/or recommendations.

The SCM should incorporate, but is not limited to, the topics listed below. Please support the SCM with the use of large-scaled maps and graphics, tables, and conceptual diagrams to illustrate key points. Please include an extended site map(s) utilizing an aerial photographic base map with sufficient resolution to show the facility, delineation of streets and property boundaries within the adjacent neighborhood, downgradient irrigation wells, and proposed locations of transects, monitoring wells, and soil vapor probes.

- a. Regional and local (on-site and off-site) geology and hydrogeology. Include a discussion of the surface geology (e.g., soil types, soil parameters, outcrops, faulting), subsurface geology (e.g., stratigraphy, continuity, and connectivity), and hydrogeology (e.g., water-bearing zones, hydrologic parameters, impermeable strata). Please include a structural contour map (top of unit) and isopach map for the aquitard that is presumed to separate your release from the deeper aquifer(s), cross sections, soil boring and monitoring well logs and locations, and copies of regional geologic maps.
- b. Analysis of the hydraulic flow system in the vicinity of the site. Include rose diagrams for depicting groundwater gradients. The rose diagram shall be plotted on groundwater elevation contour maps and updated in all future reports submitted for your site. Please address changes due to seasonal precipitation and groundwater pumping, and evaluate the potential interconnection between shallow and deep aquifers. Please include an analysis of vertical hydraulic gradients, and effects of pumping rates on hydraulic head from nearby water supply wells, if appropriate. Include hydraulic head in the different water bearing zones and hydrographs of all monitoring wells.
- c. Release history, including potential source(s) of releases, potential contaminants of concern (COC) associated with each potential release, confirmed source locations, confirmed release locations, and existing delineation of release areas. Address primary leak source(s) (e.g., a tank, sump, pipeline, etc.) and secondary sources (e.g., high-

## ATTACHMENT A

### **Site Conceptual Model (continued)**

concentration contaminants in low-permeability lithologic soil units that sustain groundwater or vapor plumes). Include local and regional plan view maps that illustrate the location of sources (former facilities, piping, tanks, etc.).

- d. Plume (soil gas and groundwater) development and dynamics including aging of source(s), phase distribution (NAPL, dissolved, vapor, residual), diving plumes, attenuation mechanisms, migration routes, preferential pathways (geologic and anthropogenic), magnitude of chemicals of concern and spatial and temporal changes in concentrations, and contaminant fate and transport. Please include three-dimensional plume maps for groundwater and two-dimensional soil vapor plume plan view maps to provide an accurate depiction of the contaminant distribution of each COC.
- e. Summary tables of chemical concentrations in different media (i.e., soil, groundwater, and soil vapor). Please include applicable environmental screening levels on all tables. Include graphs of contaminant concentrations versus time.
- f. Current and historic facility structures (e.g., buildings, drain systems, sewer systems, underground utilities, etc.) and physical features including topographical features (e.g., hills, gradients, surface vegetation, or pavement) and surface water features (e.g. routes of drainage ditches, links to water bodies). Please include current and historic site maps.
- g. Current and historic site operations/processes (e.g., parts cleaning, chemical storage areas, manufacturing, etc.).
- h. Other contaminant release sites in the vicinity of the site. Hydrogeologic and contaminant data from those sites may prove helpful in testing certain hypotheses for the SCM. Include a summary of work and technical findings from nearby release sites, including the two adjacent closed LUFT sites, (i.e., Montgomery Ward site and the Quest Laboratory site).
- i. Land uses and exposure scenarios on the facility and adjacent properties. Include beneficial resources (e.g., groundwater classification, wetlands, natural resources, etc.), resource use locations (e.g., water supply wells, surface water intakes), subpopulation types and locations (e.g., schools, hospitals, day care centers, etc.), exposure scenarios (e.g. residential, industrial, recreational, farming), and exposure pathways, and potential threat to sensitive receptors. Include an analysis of the contaminant volatilization from the subsurface to indoor/outdoor air exposure route (i.e., vapor pathway). Please include copies of Sanborn maps and aerial photographs, as appropriate.
- j. Identification and listing of specific data gaps that require further investigation during subsequent phases of work. Proposed activities to investigate and fill data gaps identified.

**TABLE 1**  
**INITIAL SITE CONCEPTUAL MODEL**

CSM Element	CSM Sub-Element	Description	Data Gap	How to Address
Geology and Hydrogeology	Regional	<p>The site is in the northwest portion of the Livermore Valley, which consists of a structural trough within the Diablo Range and contains the Livermore Valley Groundwater Basin (referred to as "the Basin") (DWR, 2006). Several faults traverse the Basin, which act as barriers to groundwater flow, as evidenced by large differences in water levels between the upgradient and downgradient sides of these faults (DWR, 2006). The Basin is divided into 12 groundwater basins, which are defined by faults and non-water-bearing geologic units (DWR, 1974).</p> <p>The hydrogeology of the Basin consists of a thick sequence of fresh-water-bearing continental deposits from alluvial fans, outwash plains, and lacustrine environments to up to approximately 5,000 feet bgs (DWR, 2006). Three defined fresh-water bearing geologic units exist within the Basin: Holocene Valley Fill (up to approximately 400 feet bgs in the central portion of the Basin), the Plio-Pleistocene Livermore Formation (generally between approximately 400 and 4,000 feet bgs in the central portion of the Basin), and the Pliocene Tassajara Formation (generally between approximately 250 and 5,000 or more feet bgs) (DWR, 1974). The Valley Fill units in the western portion of the Basin are capped by up to 40 feet of clay (DWR, 2006).</p>	None	NA
	Site	<p><b>Geology:</b> Borings advanced at the site indicate that subsurface materials consist primarily of finer-grained deposits (clay, sandy clay, silt and sandy silt) with interbedded sand lenses to 20 feet below ground surface (bgs), the approximate depth to which these borings were advanced. The documented lithology for one on-site boring that was logged to approximately 45 feet bgs indicates that beyond approximately 20 feet bgs, fine-grained soils are present to approximately 45 feet bgs. A cone penetrometer technology test indicated the presence of sandier lenses from approximately 45 to 58 feet bgs and even coarser materials (interbedded with finer-grained materials) from approximately 58 feet to 75 feet bgs, the total depth drilled. The lithology documented at the site is similar to that reported at other nearby sites, specifically the Montgomery Ward site (7575 Dublin Boulevard), the Quest laboratory site (6511 Golden Gate Drive), the Shell-branded Service Station site (11989 Dublin Boulevard), and the Chevron site (7007 San Ramon Road).</p> <p><b>Hydrogeology:</b> Shallow groundwater has been encountered at depths of approximately 9 to 15 feet bgs. The hydraulic gradient and groundwater flow direction have not been specifically evaluated at the site.</p>	<p>As noted, most borings at the site have been advanced to approximately 20 feet bgs, and one boring has been advanced and logged to 45 feet bgs; CPT data was collected to 75 feet bgs at one location. Lithologic data will be obtained from additional borings that will be advanced on site to further the understanding of the subsurface, especially with respect to deeper lithology.</p> <p>The on-site shallow groundwater horizontal gradient has not been confirmed. Additionally, it is not known if there may be a vertical component to the hydraulic gradient.</p>	<p>Two direct push borings and four multi-port wells will be advanced to depth (up to approximately 75 feet bgs) and soil lithology will be logged. See items 4 and 5 on Table 2.</p> <p>Shallow and deeper groundwater monitoring wells will be installed to provide information on lateral and vertical gradients. See Items 2 and 5 on Table 2.</p>
Surface Water Bodies		The closest surface water bodies are culverted creeks. Martin Canyon Creek flows from a gully west of the site, enters a culvert north of the site, and then bends to the south, passing approximately 1,000 feet east of the site before flowing into the Alamo Canal. Dublin Creek flows from a gully west of the site, enters a culvert approximately 750 feet south of the site, and then joins Martin Canyon Creek approximately 750 feet southeast of the site.	None	NA
Nearby Wells		The State Water Resources Control Board's GeoTracker GAMA website includes information regarding the approximate locations of water supply wells in California. In the vicinity of the site, the closest water supply wells presented on this website are depicted approximately 2 miles southeast of the site; the locations shown are approximate (within 1 mile of actual location for California Department of Public Health supply wells and 0.5 mile for other supply wells). No water-producing wells were identified within 1/4 mile of the site in the well survey conducted for the Quest Laboratory site (6511 Golden Gate Drive; documented in 2009); information documented in a 2005 report for the Chevron site at 7007 San Ramon Road indicates that a water-producing well may exist within 1/2 mile of the site.	A formal well survey is needed to identify water-producing, monitoring, cathodic protection, and dewatering wells.	Obtain data regarding nearby, permitted wells from the California Department of Water Resources and Zone 7 Water Agency (Item 11 on Table 2).

**TABLE 2**  
**DATA GAPS AND PROPOSED INVESTIGATION**

Item	Data Gap	Proposed Investigation	Rationale	Analysis
5	Evaluate the possible presence of impacts to deeper groundwater.  Evaluate deeper groundwater concentration trends over time.  Obtain data regarding the vertical groundwater gradient.  Obtain more lithological data below 20 feet bgs.	Install four continuous multichannel tubing (CMT) groundwater monitoring wells (aka multi-port wells) to approximately 65 feet bgs in the northern parking lot with ports at three depths (monitoring well locations may be adjusted pending results of shallow grab groundwater samples; we will discuss any potential changes with ACEH before proceeding). Groundwater monitoring frequency to be determined. Soil samples will be collected only if there are field indications of impacts. Soil lithology will be logged. However, information regarding the moisture content of soil may not be reliable using sonic drilling technology (two borings will be logged using direct push technology; see Item 4, above).	One well is proposed at the western (upgradient) property boundary to confirm that there are no deeper groundwater impacts from upgradient. Two wells are proposed near the center of the northern parking lot to evaluate potential impacts in an area where deeper impacts, if any, would most likely to be found. One well is proposed at the eastern (downgradient) property boundary to confirm that there are no impacts extending off-site. Port depths will be chosen based on the locations of saturated soils (as logged in direct push borings; see Item 4, above), but are expected at approximately 15, 45, and 60 feet bgs.	<i>Groundwater:</i> VOCs by EPA Method 8260, dissolved oxygen, oxidation/reduction potential, temperature, pH, and specific conductance.
6	Evaluate possible off-site migration of impacted soil vapor in the downgradient direction (east).  Evaluate concentration trends over time.	Install 4 temporary nested soil vapor probes at approximately 4 and 8 feet bgs along the eastern property boundary. Based on the results of the sampling, two sets of nested probes will be converted to vapor monitoring wells to allow for evaluation of VOC concentration trends over time.	Available data indicate that PCE and TCE are present in soil vapor in the eastern portion of the northern parking lot. Samples are proposed on approximately 50-foot intervals along the eastern property boundary to provide a transect of concentrations through the vapor plume. The depths of 4 and 8 feet bgs are chosen to provide data closest to the source (i.e., groundwater) while avoiding saturated soil, and also provide shallower data to help evaluate potential attenuation within the soil column. Two sets of nested vapor probes will be converted into vapor monitoring wells (by installing well boxes at ground surface); the locations of the permanent wells will be chosen based on the results of samples from the temporary probes.	<i>Soil vapor:</i> VOCs by EPA Method TO-15.
7	Evaluate potential for off-site migration of impacted groundwater in the downgradient direction (east).	Advance two borings to approximately 20 feet bgs in the parking lot of the property east of the Crown site for collection of grab groundwater samples.	Two borings are proposed off-site, on the property east of the Crown site, just east of the building in the expected area of highest potential VOC concentrations.	<i>Groundwater:</i> VOCs by EPA Method 8260, dissolved oxygen, oxidation/reduction potential, temperature, pH, and specific conductance.
8	Evaluate VOC concentrations just north of the highest concentration area.	Advance two borings to approximately 20 feet bgs north of Building A for collection of soil and grab groundwater samples. Soil samples will be collected at two depths in the vadose zone. Soil samples will be collected based on field indications of impacts (PID readings, odor, staining) or, in the absence of field indications of impacts, at 5 and 10 feet bgs.	The highest concentrations of PCE in groundwater were detected at boring NM-B-32, just north of Building A. The nearest available data to the north are approximately 75 feet away. One of the borings will be advanced approximately 20 feet north of NM-B-32 to provide data close to the highest concentration area. A second boring will be advanced approximately halfway between the first boring and former boring NM-B-33 to provide additional spatial data for contouring purposes. These borings will be part of a transect in the highest concentration area.	<i>Groundwater:</i> VOCs by EPA Method 8260, dissolved oxygen, oxidation/reduction potential, temperature, pH, and specific conductance.  <i>Soil:</i> VOCs by EPA Method 8260 (soil samples to be collected using field preservation in accordance with EPA Method 5035).
9	Evaluate VOC concentrations in soil vapor in the south parcel of the site.	Install four temporary soil vapor probes at approximately 5 feet bgs around boring SV-25, where PCE was detected in soil vapor at a low concentration.	PCE was detected in soil vapor sample SV-25 in the southern parcel, although was not detected in groundwater in that area. Three probes will be installed approximately 30 feet from of boring SV-25 to attempt to delineate the extent of impacts. A fourth probe is proposed west of the original sample, close to the property boundary and the location of mapped utility lines, which may be a potential conduit, to evaluate potential impacts from the west.	<i>Soil vapor:</i> VOCs by EPA Method TO-15.
10	Obtain additional information regarding subsurface structures and utilities to further evaluate migration pathways and sources.	Ground penetrating radar (GPR) and other utility locating methodologies will be used, as appropriate, to further evaluate the presence of unknown utilities and structures at the site.	Utilities have been identified at the site that include an on-site sewer lateral and drain line, and shallow water, electric, and gas lines. Given the current understanding of the distribution of PCE in groundwater at the site, it is possible that other subsurface utilities, and specifically sewer laterals, exist that may act as a source or migration pathway for distribution of VOCs in the subsurface.	NA
