Re: Chevron Service Station #9-0076
4265 Foothill Blvd.
Oakland , California

Dear Mr. Chan:

Enclosed is a copy of the Risk Based Corrective Action (RBCA) Tier 2 Risk Evaluation, dated December 12, 1997, that was prepared for this site by Chevron Research and Technology Company and at the request of Mr. Barney Chan, Alameda County Health Care Services. This risk evaluation was based on the indoor air inhalation of vapors from subsurface soil and groundwater present at the site.

The exposure pathway modeled was for the inhalation of vapors by an adult receptor directly above the contaminant sources. Contaminants of concern (COC) in the soil and groundwater were BTEX and MtBE and risk ranges of 1e-5 and 1e-6 were used for the commercial and residential exposure scenarios. Representative concentrations for this evaluation were the 95% Upper Confidence Limit (UCL) values for soil and groundwater calculated in the GSI ASTM RBCA software package. Site-specific target levels (SSTL's) for each COC at a specific target risk value, 1e-5 or 1e-6, were generated based on site-specific and default parameter data for the site. These SSTL's were then compared to the 95% UCL concentrations and risk values were estimated for the indoor air inhalation of vapors from site soils and groundwater for the residential and commercial exposure scenarios.

The estimated risk for residential exposure to indoor air inhalation of vapors is exceeded for the site soils but not for the groundwater. The estimated risk for commercial exposure to indoor inhalation of vapors is not exceeded for soils and groundwater.

December 18, 1997
Mr. Barney Chan
Chevron Service Station # 9-0076
Page 2

Therefore, based on the results of this RBCA evaluation, residential exposure to inhalation of vapors from site groundwater would not pose a potential health risk, however, the exposure from the inhalation of vapors from the soils would pose a potential residential health risk. Commercial exposure to inhalation of vapors from site soil and groundwater would not pose a potential health risk. Because residences are not located directly above the site soils, the modeled potential health risk by the residential exposure pathway may not be considered significant. The modeled commercial health risk to site workers does not exceed the 1e-5 risk level and may not be considered significant.

If you have any questions or comments to this RBCA contact Curt Peck at (510) 242-7086 or myself at (510) 842-9136.

If you have any questions, call me at (510) 842-9136.

Sincerely,
CHEVRON PRODUCTS COMPANY

Philip R. Briggs

MEMORANDUM

December 12, 1997
Richmond, California

RBCA Evaluation
Indoor Inhalation from Soil and Groundwater
Chevron Service Station #9-0076
4265 Foothill Boulevard
Oakland, California

Mr. Phil Briggs:
San Ramon, California

This memorandum is submitted to fulfill a request by Barney Chan, Alameda County Health Care Services Department, to complete a risk evaluation based on the indoor air inhalation of vapors from subsurface soil and groundwater present at this site. Contaminants of concern (COC's) in the soil and groundwater were BTEX and MTBE and risk ranges of 1e-5 and 1e-6 were used for used for the commercial and residential exposure scenarios. Soil boring data from site assessment and product pipeline replacement activities were used to determine contaminant concentrations in the site soils. Groundwater data from the past year of sampling from the 9 monitoring wells at the site were used to determine the dissolved contaminant concentration and average depth to groundwater for the site. Representative concentrations for this evaluation were the 95% Upper Confidence Limit (UCL) values for soil and groundwater calculated in the GSI ASTM RBCA software package. Site-specific target levels (SSTL's) for each COC at a specific target risk value, either 1e-5 or 1e-6, were generated based on site-specific and default parameter data for the site. These SSTL's were then compared to the 95% UCL concentrations and risk values were estimated for the indoor air inhalation of vapors from site soils and groundwater for the residential and commercial exposure scenarios.

Exposure Scenarios

The exposure pathway modeled was for indoor air inhalation of vapors from site soils and groundwater. This exposure pathway assumes that the receptor (adult) is located directly above the contaminant sources. Exposure parameters for both residential and commercial exposure are presented in Output Tables 1A and 1B. Output Table 1A gives the parameters used in the model for the residential evaluation. Site-specific parameters for vadose zone thickness, capillary zone thickness, depth to groundwater and vertical extent of soil contamination were input with the model default parameters to generate an estimated health risk value for this exposure route. Soil and groundwater data were used to generate SSTL's for this site. Output Table 1B lists the exposure parameters input into the RBCA model for the commercial exposure evaluation.

Results

The estimated risk associated with residential exposure to indoor air inhalation of vapors from site subsurface soils and groundwater is 1.2e-5, above the 1e-6 estimated risk value considered acceptable for residential exposure. The estimated risk is driven by the site soils (specifically, samples C-A-8.5' and C-2-9') and not by the site groundwater. The site soils generate the 1.2e-5 risk value and the site groundwater generates a 6.4e-7 risk value. The soil SSTL (at 1e-6) for benzene is 0.0074 mg/Kg, which is exceeded by the 95% UCL concentration of 0.085 mg/Kg. The groundwater SSTL (at 1e-6) for benzene is 0.15 mg/L, above the 95% UCL concentration of 0.096 mg/L.

*1/10/98
Overset*

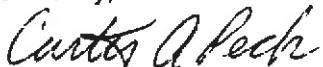

The estimated risk associated with commercial exposure to indoor inhalation of vapors from site subsurface soils and groundwater is 4.6e-6, below the 1e-5 estimated risk value considered acceptable for commercial exposure. Again, the estimated risk is driven by the site soils (samples C-A-8' and C-2-9') and not by the site groundwater. The site soils generate the 4.5e-6 risk value and the site groundwater generates a 2e-7 risk value. The soil SSTL (at 1e-5) for benzene is 0.19 mg/Kg, above the 95% UCL concentration of 0.085 mg/Kg. The groundwater SSTL (at 1e-5) for benzene is 4.8 mg/L, above the 95% UCL concentration of 0.096 mg/L.

Summary

Based on the results of this RBCA evaluation, site soil contaminant levels may generate a potential human health risk for residential exposure to inhalation of indoor vapors from site soils. Residential exposure to inhalation of vapors from site groundwater would not pose a potential health risk and commercial exposure to indoor inhalation of vapors from both soil and groundwater would also not pose a potential health risk. Because residences are not located directly above the site soils, the modeled potential health threat by the residential exposure pathway may not be considered significant. The modeled commercial health threat to site workers does not exceed the 1e-5 risk level and may not be considered significant.

Please contact me at 242-7086 with questions or comments regarding this evaluation.

Sincerely,

Curtis A. Peck

Senior Hydrogeologist

Note: Blaine Tech Services, Inc. began routine monitoring of the groundwater wells at this site on November 1, 1994.
 Earlier field data and analytical results are drawn from the September 27, 1994 Groundwater Technology, Inc. report.

ABBREVIATIONS:

TPH = Total Petroleum Hydrocarbons

MTBE = Methyl t-Butyl Ether

ND = Not detected at or above the minimum quantitation limit. See laboratory reports for minimum quantitation limits.

Table 1. Analytical Results - Chevron Service Station #9-0076, 4265 Foothill Boulevard, Oakland, California.

EXPLANATION:

TPHg = Total Petroleum Hydrocarbons as gasoline

MTBE = Methyl t-Butyl Ether

ppm = Parts per million

— = Not analyzed/not applicable

¹ = Gasoline and unidentified hydrocarbons > C8² = STLC extract result³ = TCLP extract result

* = Sample was also analyzed for Halogenated Volatile Organics by EPA Method 8010 - all compounds were not detected.

ANALYTICAL METHODS:

TPHg = EPA Method 8015 Mod.

Benzene, toluene, ethylbenzene, xylenes, and MTBE = EPA Method 8020

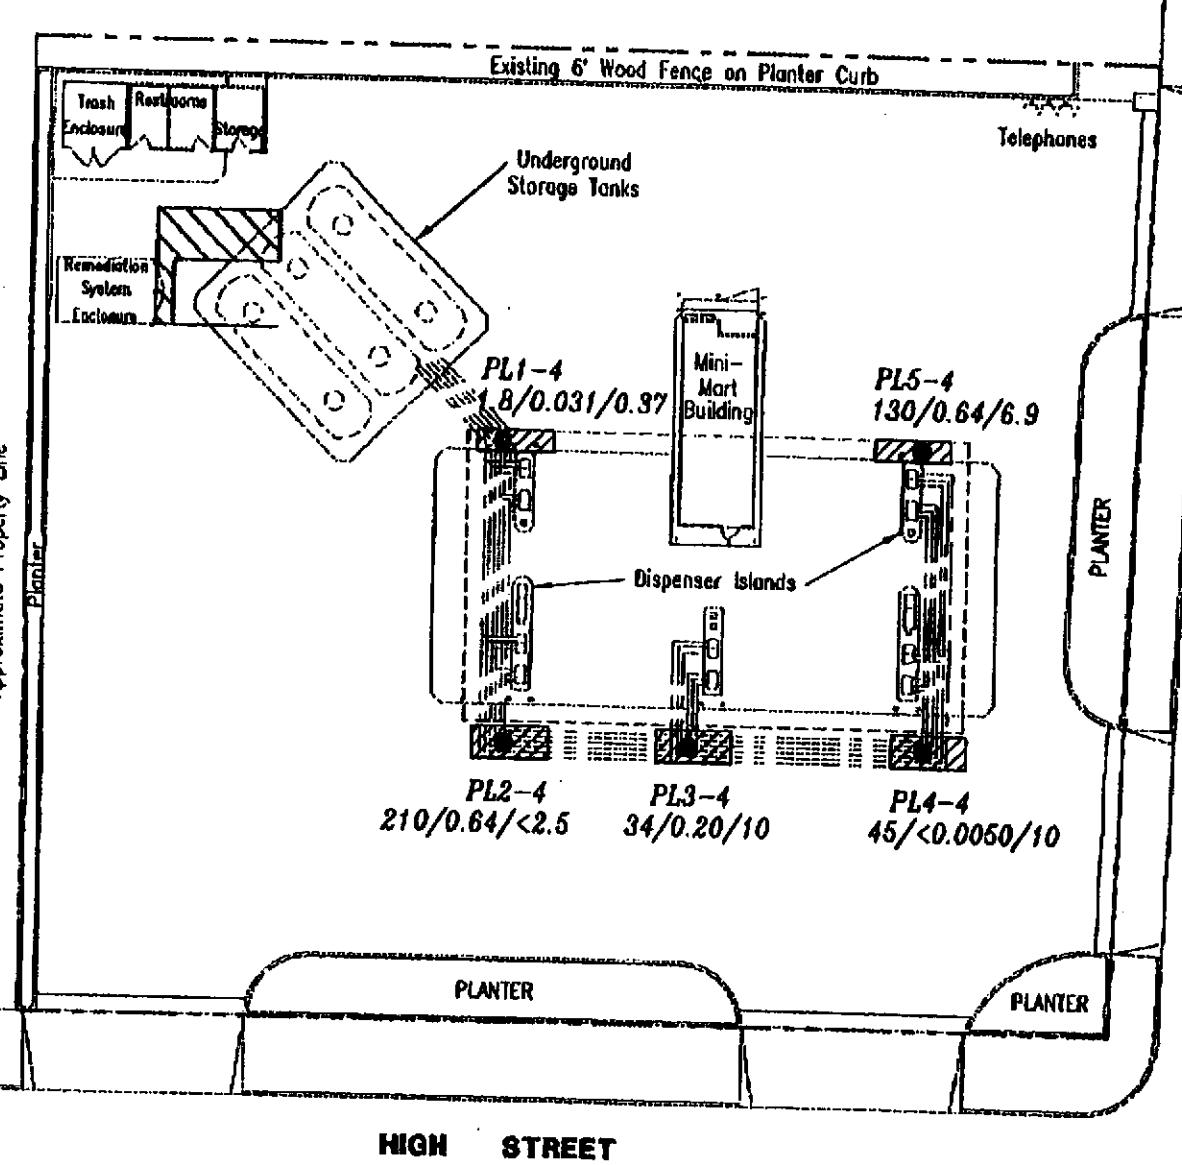

Lead = EPA 6010

ANALYTICAL LABORATORY:

Sequoia Analytical (ELAP #1271)

Abbreviations:

TPH-G = Total Petroleum Hydrocarbons as Gasoline
 B = Benzene
 E = Ethylbenzene
 T = Toluene
 X = Xylenes
 Sat = Saturated soil sample
 Unsat = Unsaturated soil sample
 <n = Not detected at detection limit of n ppm

Analytical Laboratory:

GTEL = GTEL Environmental Laboratories, Concord, California

Analytic Methods:

8015 = Modified EPA Method 8015 for TPH-G

8020 = EPA Method 8020 for BETX
