PROGRESS REPORT AND WORKPLAN FOR THE INSTALLATION OF ONE SOIL RE:

BORING

Dear Mr. Chan:

Enclosed is a progress report and workplan for the subject location prepared for Mobil Business Resources Corporation by Alton Geoscience. Copies of this report have been sent to:

1. Ms. Cherine Foutch Mobil Business Resources Corporation 2063 Main Street, No. 501 Oakley, California 94561

2. Mr. Chuck Headlee Regional Water Quality Control Board San Francisco Bay Region 1515 Clay Street, Suite 1400 Oakland, California 94612

3. Ms. Connie Lamb 200 Dorado Terrace San Francisco, California 94112

Jam 4. 92

If you have questions, please call me at (925) 688-2474.

Sincerely,

Thomas E. Seeliger

RE:

PROGRESS REPORT AND WORKPLAN FOR THE INSTALLATION OF ONE

SOIL BORING

Dear Mr. Chan:

TRC/Alton Geoscience submits this progress report and workplan for the completion of one soil boring east of monitoring well MW-4, at former Mobil Service Station 99-105, located at 6301 San Pablo Avenue, Oakland, California (Figure 1). This workplan is in accordance with the Alameda County Health Care Services letter, dated July 16, 1999 (Appendix A).

1.0 SITE DESCRIPTION

Present Site Use:

The property is currently unoccupied and is being developed into an

automobile oil change facility.

Past Site Use:

The site was a Mobil service station from 1951 to 1980 before being used

as a car rental lot. The former underground storage tanks (USTs) were not

in use after 1980.

Adjacent Property:

The site is located on the northwest corner of San Pablo Avenue and 63rd

Street in Oakland, California (Figure 1). Commercial properties are to the north and northeast across San Pablo Avenue. To the southeast, across San Pablo Avenue, is an elementary school, and to the west, south, and

southwest are residential properties.

Geography:

San Francisco Bay is located approximately 5,000 feet to the west of the

site. Topography in the vicinity of the site is relatively flat but slopes gently west towards the bay. The site has an elevation of approximately 22 feet

above mean sea level [NGVD 1929].

Former Mobil Service Station 99-105, Oakland, California

November 3, 1999

Soil Lithology:

Soils encountered in MW-2 and MW-3 generally consisted of silty and gravelly sands interbedded with sandy silts and silty clays from grade to the total depth of the boring. Sandy silts and silty sands were encountered in Boring MW-1 and clays and clayey and silty sands in Boring MW-4 from grade to the total depth of the borings.

Regional Geology

The site is underlain by the Quaternary Temescal Formation, which consists of interfingering layers of clayey gravel, sandy silty clay, and various clay-silt-sand mixtures. The formation varies in thickness to a maximum of approximately 60 feet. Underlying the Temescal Formation is the Quaternary Alameda Formation, which consists of unconsolidated continental and marine gravel's, sands, silts, and clays, with some shells and organic material in places. The formation has a maximum known thickness of 1,050 feet (Radbruck, 1957).

Regional

Hydrogeology:

The site is located in the East Bay Plain Groundwater Basin. Generally groundwater flows westward towards the Bay (Regional Water Quality Control Board, 1995)

Sensitive

Receptors:

A sensitive receptor survey conducted in May 1998 indicated that no supply wells were located within a 1/2 mile radius of the site. San Francisco Bay is located approximately 5,000 ft to the west of the site. To the southeast, across San Pablo Avenue, is an elementary school.

3.0 SITE HISTORY

Four gasoline and one waste oil USTs were excavated and removed in 1994 (Figure 2). Holes were noted in two of the gasoline USTs. The product piping was removed from the site in February 1996. An estimated total of 367 cubic yards of soil was excavated and removed from the site during the UST and piping removals.

Four groundwater monitoring wells (MW-1 through MW-4) were installed in March 1996 (Alisto, 1996).

Former Mobil Service Station 99-105, Oakland, California November 3, 1999

Thirteen soil borings (AB-1 through AB-13) were drilled at the site in March 1998 (Figure 3) (Alton 1998a).

In November 1998, six temporary monitoring points (MP-1 through MP-6) (Figure 3) were advanced to further characterize the extent of hydrocarbon-affected vadose zone soil and to obtain vacuum readings and groundwater depths during a dual-phase vacuum extraction (DPVE) event.

On November 19, 1998, a DPVE event was conducted to reduce the level of dissolved-phase hydrocarbons at the site. Groundwater and vapors were extracted from wells MW-3 and MW-4. Vacuum response and groundwater depths were measured in the temporary monitoring points and monitoring wells during the DPVE event. Approximately 21 pounds of vapor-phase hydrocarbons and 75 gallons of hydrocarbon-affected groundwater were recovered during the event (Alton 1999b). Following the extraction event, monitoring points MP-1 through MP-6 were destroyed.

Monitoring well MW-4 was inadvertently destroyed prior to April 1999 during construction activities conducted by the current property owner. MW-1 was properly destroyed during July 1999 in preparation of proposed construction activities (Figure 4).

4.0 CURRENT SITE CONDITIONS

Assessment activities conducted at the site from 1994 to present have adequately defined soil impacted by petroleum hydrocarbons. Concentrations of total petroleum hydrocarbons as gasoline (TPH-G) in excess of 100 parts per million (ppm) appear to be confined to the central portion of the site (Figure 3). Benzene concentrations in excess of 1 ppm within the vadose zone were only detected in MW-4 (1.2 ppm) at a depth of 5.5 feet below grade (fbg). Soil in the vicinity of MW-4 was excavated to a depth of 6 feet during redevelopment activities in 1998 (Figure 4).

Fourteen quarters of groundwater monitoring and sampling have been conducted at the site since the installations of MW-1 through MW-4. Elevated levels of hydrocarbons are present in Monitoring Well MW-3. Liquid-phase hydrocarbons have been periodically detected in MW-4 since the third quarter of 1996. On January 27, 1999, 0.07 foot of liquid-phase hydrocarbons was measured in MW-4 (Alton 1999b), prior to the monitoring well being destroyed during construction activities at the site. The average groundwater depth at the site is approximately 6.38 fbg, based on fluid level measurements collected on January 27, 1999 (Alton 1999a). Historical groundwater depths have ranged from 3.83 fbg (MW-1) measured on January 31, 1997 to 11.57 fbg (MW-3) measured on October 20, 1998. The groundwater gradient was calculated to be 0.06 feet per foot (ft/ft) in January 1999 and groundwater flow has varied from the northwest (April 1997) to southwest (January 1999) (Alton 1998c and Alton 1999a). Methyl tert butyl ether (MTBE) has not been detected by Environmental Protection Agency (EPA) Methods 8240 or 8260 at the site.

Former Mobil Service Station 99-105, Oakland, California November 3, 1999

4.0 PLANNED BORING INSTALLATION ACTIVITIES

4.1 OBJECTIVES

The proposed soil boring is being installed to determine the extent of free product and determine if any active remediation is necessary.

4.2 PRE-FIELD WORK ACTIVITIES

A soil boring permit will be acquired and a geophysical survey will be conducted prior to field activities. The site will be marked and Underground Service Alert (USA) will be notified approximately 3 days prior to field activities.

4.3 GROUNDWATER SAMPLING

One onsite soil boring will be advanced to two feet below the groundwater interface, approximately 10 fbg, using a direct-push rig. The proposed boring location is shown on Figure 2.

The water sample will be analyzed for the following: TPH-G using EPA Method 8015 modified for gasoline; and benzene, toluene, ethylbenzene, and total xylenes (BTEX) and MTBE using EPA Method 8020. General field procedures pertaining to water sample collection are presented in Appendix B.

4.4 SITE ASSESSMENT REPORT AND RISK-BASED CORRECTION ACTION EVALUATION

Following the fieldwork and receipt of the laboratory results, a report of the supplementary site assessment activities and either a Tier 1 or Tier 2 risk-based corrective action (RBCA) evaluation will be submitted to the Alameda County Department of Health Services. The report will contain the boring log, laboratory analytical results, findings, conclusions, and RBCA evaluation, and will be certified by a California Registered Geologist.

Former Mobil Service Station 99-105, Oakland, California November 3, 1999

5.0 WORK SCHEDULE

Planned activities will be performed according to the following estimated completion schedule:

☐ Expected agency approval of workplan:

within three weeks of submittal.

☐ Drill boring:

within two to three weeks of workplan

approval.

☐ Submit site assessment report and RBCA:

within six weeks of completion of field

activities.

6.0 SITE HEALTH AND SAFETY PLAN

A site health and safety plan designed to promote project personnel safety and preparedness during the activities described in this work plan is presented in Appendix C.

If you have any questions regarding this workplan, please call us at (925) 688-1200.

Sincerely,

Tom Seeliger

Ms. Cherine Foutch Mobil Oil Co. 2063 Main St. Oakley, CA 95641

Ms. Connie Lamb 200 Dorado Terrace San Francisco, CA 94112

Re: Subsurface Investigation at 6301 San Pablo Ave., Oakland CA 94608

Dear Ms. Foutch and Ms. Lamb:

This letter is to update you on the responses received to my July 9, 1999 letter from your consultants. As you are aware, most of the items requested by our office have been met as outlined in my prior letter. These items were necessary for either health and safety or site investigation reasons. It will be up to you to determine who is responsible for the remaining items requested.

Our office is still in need of the following:

- A plot plan with the newly proposed building outline overlaid on existing data points
- A work plan for the installation of a replacement well for MW-4
- A work plan for the sampling of one grab groundwater sample, just east of MW-4. Please note that this item is requested in lieu of the previously request for two vadose soil and two grab groundwater samples, which are now considered unnecessary due to existing data. This new data will be used to determine the extent of free product and determine if any active remediation is necessary.

Please provide the above items as soon as possible.

You may contact me at (510) 567-6765 if you have any questions.

Sincerely,

Barney M. Chan

APPENDIX B GENERAL FIELD PROCEDURES

GENERAL FIELD PROCEDURES

A description of the general field procedures used during site investigation and monitoring activities is presented below. For an overview of protocol, refer to the appropriate section(s).

DRILLING AND SOIL SAMPLING

Soil borings are advanced using a truck-mounted GeoprobeTM rig. Borings are grouted to the ground surface with a cement slurry, which is placed in each boring using a tremie pipe.

Soil samples are obtained for soil description, field hydrocarbon vapor screening, and possible laboratory analysis. Soil samples are retrieved from the borings by one of two methods: 1) continuously, using a 1 and 3/4-inch diameter 4-foot-long, continuous-core macro core sampler lined with acetate or brass sleeves, or; 2) at specific intervals using an 1-inch diameter 2-foot-long, continuous-core micro core sampler lined with acetate or brass sleeves, each advanced into the soil with a weighted or vibrating hammer.

During drilling activities, soil adjacent to the laboratory sample is screened for combustible vapors using a combustible gas indicator (CGI) or equivalent field instrument. For each hydrocarbon vapor screening event, a 6-inch-long by 2.5-inch-diameter sample insert is filled approximately 1/3 full with the soil sample, capped at both ends, and shaken. The probe is then inserted through a small opening in the cap, and a reading is taken after approximately 15 seconds and recorded on the boring log. The remaining soil recovered is removed from the sample insert or sampler, and described in accordance with the Unified Soil Classification System. For each sampling interval, field estimates of soil type, density/consistency, moisture, color, and grading were recorded on the boring logs.

SOIL SAMPLE HANDLING

Upon retrieval, soil samples are immediately removed from the sampler, sealed with Teflon sheeting and polyurethane caps, and wrapped with tape. Each sample is labeled with the project number, boring/well number, sample depth, geologist's initials, and date of collection. After the samples have been labeled and documented in the chain of custody record, they are placed in a cooler with ice at approximately 4 degrees Celsius (°C) prior to and during transport to a state-certified laboratory for analysis. Samples not selected for immediate analysis may be transported in a cooler with ice and archived in a frostless refrigerator at approximately 4°C for possible future testing.

FLUID LEVEL MONITORING

Fluid levels are monitored in the wells using a water level indicator with conductance sensors. The depth to water is measured relative to the well box top or top of casing. Well box or casing elevations are surveyed to within 0.02 foot relative to a county or city benchmark.

GROUNDWATER SAMPLING

Groundwater samples are collected by lowering a disposable polyethylene bailer just below the static water level in the well. The samples are carefully transferred from the check-valve-equipped bailer to 1-liter and 40-milliliter glass containers. The sample containers are filled to zero headspace and fitted with Teflon-sealed caps. Each sample is labeled with the project number, well number, sample date, and sampler's initials. Samples remain chilled at approximately 4°C prior to analysis by a state-certified laboratory.

CHAIN OF CUSTODY PROTOCOL

Chain of custody protocol is followed for all soil and groundwater samples selected for laboratory analysis. The chain of custody form(s) accompanies the samples from the sampling locality to the laboratory, providing a continuous record of possession prior to analysis.

DECONTAMINATION

Drilling and Soil Sampling

Drilling equipment is decontaminated by steam cleaning before being brought onsite. The augers are also steam cleaned before each new boring is commenced. Prior to use, the sampler and sampling tubes are brush-scrubbed in a Liqui-nox and potable water solution and rinsed twice in clean potable water. Sampling equipment and tubes are also decontaminated before each sample is collected to avoid cross-contamination between borings.

Groundwater Sampling

Purging and sampling equipment that could contact well fluids is either dedicated to a particular well or cleaned prior to each use in a Liqui-nox solution followed by two tap water rinses.

APPENDIX C SITE HEALTH AND SAFETY PLAN

SITE HEALTH AND SAFETY PLAN

For

Soil Boring Installation Former Mobil Station 99-105 6301 San Pablo Avenue, Oakland, California

1.0 PLAN SUMMARY

This Site Health and Safety Plan (SHSP) establishes responsibilities, requirements, and procedures for the protection of personnel while performing activities at the above-referenced site. This site-specific plan conforms with the Alton Geoscience Corporate Health and Safety Plan, Hazard Communication Program, and Injury and Illness Prevention Program (IIPP).

During site work, the use of proper health and safety procedures, in accordance with applicable Cal/OSHA regulations shall be required. Site-specific conditions may necessitate modification of the SHSP; however, except in emergency situations no deviations from the plan may be implemented without the prior notification and approval of the Site Safety Officer (SSO).

2.0 SITE INFORMATION

This SHSP considers the physical, chemical, and environmental hazards that may be encountered during work activities at the site. Operations associated with this SHSP will be conducted in accordance with an approved workplan. Any changes required or made to the planned activities will be immediately communicated to site personnel by the SSO. Summary information for this project is provided in the following table.

Workplan dated:	
Principal activities:	Soil boring installation and collection of groundwater sample.
Site description (see Attachment A for site map):	Vacant lot. Former auto repair facility and service station.
Approximate depth to groundwater:	Approximately 7 fbg
Contaminants of concern (see Attachment B):	Gasoline Hydrocarbons

3.0 SITE SAFETY AUTHORITY

Contact information and names of authorized personnel are listed below. A description of responsibilities follows.

Role	Name	Company	Telephone
Site Safety Officer	Shayne Pasek	TRC/Alton Geoscience	pgr. (925) 275-5798
Alternate Site Safety Officer			
Project Manager	Tom Seeliger	TRC/Alton Geoscience	(925) 688-2474
Supervisor/Offsite Coordinator	Tracy Walker	TRC/Alton Geoscience	(925) 688-2476
Local IIPP Coordinator	Chris Smiga	Alton Geoscience	(925) 688-2475
Client Contact	Cherine Foutch	Mobil Oil Corporation	(925) 625-1173

Site Safety Officer: The SSO is responsible for briefing site personnel on potential physical and chemical hazards prior to work start-up, during operations, and whenever other health and safety matters need to be addressed. The SSO will be in charge of conducting the daily Tailgate Safety Meetings. The SSO will see that this SHSP is available onsite and is understood and signed by personnel entering the site. The SSO is also responsible for implementing emergency response procedures when necessary. In the event the SSO is unable to perform these duties, the Alternate SSO will be responsible.

Project Manager: The Project Manager (PM), in coordination with the SSO, is responsible for implementing health and safety requirements, including seeing that the SHSP is prepared and available onsite. The PM is the central point of contact for the SSO, Client, and Field Personnel, and has overall responsibility for site operations.

Field Personnel: Field Personnel are responsible for understanding and complying with this SHSP. Field Personnel include both Alton employees and Subcontractors hired by Alton Geoscience. Field Personnel are required to participate in briefings prior to commencement of site work; attend daily Tailgate Safety Meetings; and acknowledge receipt and understanding of the SHSP by signing the Compliance Log at the end of this plan.

Supervisor/Offsite Coordinator: The Supervisor/Offsite Coordinator, typically the Alton branch manager, should be contacted when mobilization of support from an Alton office is needed, and in case of an emergency requiring offsite assistance.

4.0 SITE CONTROL

Site control requires the establishment of a regulated area with designated work zones, evacuation protocol, location of medical assistance, site security, and communication guidelines that include a "Buddy System."

4.1 REGULATED AREA(S)

Each site will have an established Exclusion Zone with controlled access, and a Support Zone. Supervision and strict control of access to regulated areas is necessary to protect site personnel as well as the public.

Exclusion Zone: (a.k.a. "Hot Zone") This is the area where personnel may be subject to chemical or physical hazards. It is the zone of known or suspected contamination, where equipment operation and/or environmental sampling will take place. The Exclusion Zone is to be clearly identified and isolated with cones, barricades, or high visibility caution tape. Personnel working in the Exclusion Zone will at a minimum use Level D personal protective equipment as described in Section 7.0.

The outer boundary of the Exclusion Zone ("Hot Line") will be established by the SSO, so that sufficient area is available to conduct operations while providing a protective buffer for persons and property outside the zone.

Support Zone: (a.k.a. "Safe Zone") This is the area outside the Exclusion Zone where administrative and other support functions are located. Adverse exposure to contaminants and physical hazards are unlikely in the Support Zone.

4.2 EVACUATION PROTOCOL

Evacuation protocol and routes from the site will be established by the SSO, and communicated to Field Personnel during the Tailgate Safety Meeting(s) prior to initiating work. Evacuation protocol will be implemented as needed in emergency situations. In the event of an evacuation, personnel will meet at a preestablished location and the SSO will do a "head count" to see that everyone has left the hazard area.

Emergency Response procedures are outlined in Section 12.0. Directions to the nearest medical facilities are provided in ATTACHMENT C.

4.3 SITE SECURITY

Appropriate security measures will be established in coordination with the site owner/operator and communicated to site personnel. The objective of these measures is to (1) protect the public from potential exposure to physical/chemical hazards; (2) avoid public interference with personnel and safe work practices; and (3) prevent theft or vandalism of equipment at the site.

4.4 COMMUNICATION

Communication is an important aspect of the site control program as well as the entire SHSP. Personnel should keep in mind that hazard assessment is a continuous process, and any potentially unsafe condition must be reported immediately to the SSO.

Onsite personnel will use the "Buddy System" and maintain communication or visual contact between team members during site operations. The Buddy System is used to provide assistance, monitor for chemical exposure and heat stress, and obtain emergency assistance for coworkers when necessary. Site personnel will be familiar with the following emergency hand signals:

Hand gripping throat:

Can't breathe. Respirator problems.

Grip team member's wrist or both hands on team member's

waist:

Leave site immediately, no debate!

Thumbs up:

Yes. I'm alright. I understand.

Thumbs down:

No. Negative.

5.0 HAZARD ASSESSMENT

Hazard assessment is essential for establishing hazard reduction measures. Hazard assessment will consist primarily of site inspections and monitoring. Known operational hazards (heavy equipment, overhead lines, etc.) and site characterization data (contaminant location, concentration, etc.) are also considered in the assessment. The following is a list of potential hazards associated with the activities planned for this site:

Physical Hazards	Drilling equipment Tripping, slipping, and falling Head, foot, eye, and back injuries Sharp objects
Chemical Hazards	Gasoline / benzene, toluene, ethylbenzene, xylenes (BTEX) Diesel, Stove oil,
Environmental Hazards	Noise exposure Weather - heat, cold, rain, fog Biological - plants, animals/insects, pathogens

Walk-though safety inspections will be conducted by the SSO daily and as conditions change. Inspection results will be communicated to the work crews during the morning Tailgate Safety Meetings and as needed.

6.0 HAZARD REDUCTION

Personnel are required to exercise reasonable caution at all times during work activities. Failure to follow safety protocols and/or continued negligence of health and safety policies will result in expulsion of a crew member from the site and may result in termination of employment. In general, the potential for hazardous situations will be reduced by the following activities:

Implementing engineering controls

Using personal protective equipment

Performing air monitoring

Engineering Controls, corresponding to the hazard assessment for work at this site, are outlined below in Sections 6.1 through 6.4. Personal protective equipment (PPE) and air monitoring guidelines are outlined in Sections 7.0 and 8.0, respectively.

6.1 PHYSICAL HAZARDS AND CONTROLS

Drilling Equipment

The operation and use of drilling equipment presents the greatest potential for injury to personnel. To minimize these hazards, designated routes and specific traffic patterns will be established. Trucks will use spotters for backing. If personnel need to approach drilling equipment during operation, they will observe the following protocols: make eye contact with the operator, and then approach the equipment to inform operator of intentions.

Only equipment that is in safe working order will be used. Only qualified personnel will be allowed to operate drilling equipment. Subcontractors will supply proof of qualifications to operate the equipment. Those crew members directly involved in spotting for the operator will be the only personnel allowed within the operating radius of the drilling equipment. Other personnel will remain at a safe distance from these operations.

Explosion and Fire

Liquid petroleum products readily vaporize from standing pools or saturated soil. Ignition sources pose an explosion and fire hazard (e.g., engines, impact sparking, and heat or arc from inappropriate equipment or instrumentation). A direct-reading combustible gas indicator (CGI) will be used to evaluate the possible formation of flammable atmospheres in and around the work area. See Section 8.0: Air Monitoring.

Emergency services (911) are to be called immediately in case of a fire or explosion. A portable fire extinguisher will be kept onsite for use on small fires only. Only personnel trained in the proper use of fire extinguishers are authorized to use the onsite fire extinguisher.

Tripping, Slipping, and Falling

Personnel will be reminded daily to maintain sure footing on all surfaces. Use of safety harnesses is required for personnel working 6 feet or more above any surface that does not have handrails (includes riding on manlifts). Work surfaces of unknown or suspect integrity will be strengthened or overlaid with a work platform capable of supporting personnel and equipment working in the area. To minimize tripping hazards caused by construction and other debris, material will be removed daily from the work areas and stockpiled in appropriate designated storage areas. This "housekeeping" effort will be enforced by the SSO at the end of each day.

Head, Foot, Eye, and Back Injuries

Hard hats, steel toe boots, and safety glasses will be worn during site operations. To avoid back injuries, personnel will be trained in and required to use proper equipment and lifting techniques for manual material handling.

Sharp Objects

Nails, wires, saws, and cutting equipment pose potential hazards such as cuts and punctures during site work. Only appropriate work tools are to be used. Personnel are required to exercise caution, and should wear leather work gloves when handling or operating cutting tools, saws, and other sharp objects. A consistent housekeeping effort at the site will also help to reduce hazards from sharp objects.

6.2 CHEMICAL HAZARDS AND CONTROLS

Chemical Characteristics

Hazardous chemicals that may be encountered at this site include gasoline, diesel, stove oil, hydraulic oil hydrocarbons. These chemicals may be volatile, flammable, moderately to extremely toxic, or carcinogenic when inhaled, ingested, or absorbed above certain concentrations. See ATTACHMENT B for specific exposure limits and basic toxicology information.

Personnel will use engineering controls and PPE (based on hazard assessment) to prevent chemical exposure.

Sample Collection

Workers who must come in direct contact with known or suspected contaminated soil or groundwater to collect samples are required to wear protective gloves and other PPE, as needed, to reduce the potential for exposure. Safety glasses will be worn to avoid potential splashing of chemicals into the eyes.

Soil Cuttings, Decontamination Water, and Dust

As with sample collection, precautions are to be followed for handling materials such as soil cuttings and cleaning/decontamination water. Exposure and potential inhalation of dust (nuisance, silica) will be minimized by wearing dust masks or other appropriate PPE/respiratory protection.

Disposition of Materials

Excavated soil will be stockpiled and covered, or stored in closed drums or roll-off bins. Purged water will be stored in closed drums or tanks. Drums, tanks, and/or roll-off bins containing soil or

water will be labeled in accordance with the hazard communication standard and removed from the site in accordance with client-approved protocol.

Hygiene

Eating, smoking, and drinking is NOT ALLOWED in the work area. Site personnel will wash their hands, arms, and faces thoroughly prior to eating or drinking, and at the end of their shift. Food should never be stored where it may come into contact with, or be contaminated by, petroleum products, pesticides, or other toxic materials.

6.3 ENVIRONMENTAL HAZARDS AND CONTROLS

Noise Exposure

Hearing protection (ear plugs or ear muffs) will be worn when project personnel enter high-noise areas. The SSO should see that extra ear plugs are available onsite.

Heat Stress

Heat stress may be caused by the combination of ambient factors such as high air temperature, high relative humidity, and low air movement. This condition can result in heat rash, heat cramps, heat exhaustion, and/or heat stroke. It can impair worker coordination and judgement and directly impact health and safety. Heat stress is more likely when PPE is worn. Personnel are to drink plenty of water and take breaks (in shaded rest areas) as needed to help prevent heat stress. As part of the Buddy System, personnel should watch for signs and symptoms of heat stress in coworkers as well as themselves.

Cold Exposure

To guard against cold injury (frostbite and hypothermia), which is a danger when the temperature and wind-chill factor are low, employees will wear appropriate clothing, have warm shelter readily available, and maintain carefully scheduled work and rest periods.

Biological Hazards

Personnel will assess their surroundings for potential biological hazards, which may be posed by poisonous plants, insects, animals, and indigenous pathogens. Protective clothing and respiratory equipment can help reduce the chances of exposure. Thorough washing of any exposed body parts and equipment will help protect against infection from biological hazards. "Universal Precautions" (e.g., wearing latex gloves) must be taken any time there is potential for exposure to human blood, such as when an employee renders first aid to a coworker.

6.4 CONFINED SPACE HAZARDS

Confined space entry is NOT ANTICIPATED during the course of these operations. However, if such a situation is encountered, workers are prohibited from entering confined spaces until the company plan dealing with confined spaces has been implemented.

7.0 PERSONAL PROTECTIVE EQUIPMENT

7.1 LEVEL OF PROTECTION

Personnel are required to wear PPE appropriate for the task and anticipated exposure to known contaminants. Selection of PPE will be based on hazard assessment, task performance, and air monitoring. Based on the history of this site, the initial level of protection will be Level D. At a minimum, Level D PPE will consist of the following:

- Hardhat
 at all times in work area
- Boots: chemical-resistant, steel toe and shank
 at all times in work area
- Safety glasses, splash goggles, or hardhat with face shield when there is risk of hazardous substances (sampling) or flying particles (drilling, excavation, etc.) getting into eyes
- Ear plugs / hearing protection

 when high-noise equipment/drill rig is in operation
- Gloves: chemical-resistant
 when handling soil cuttings or soil/water samples

Site personnel also are required to *be prepared* with the following items:

- Respirators: half-face, air-purifying with appropriate cartridges
- Dust masks
- Tyvek coveralls and other suitable protective clothing
- Traffic safety vest

Leather work gloves and back brace/lifting belt

Air monitoring information will dictate when and if a site will be upgraded to Modified Level D (Level D plus respirator).

7.2 RESPIRATOR SELECTION

For operations that require the use of a respirator, the SSO must verify that Field Personnel are medically approved to use respiratory equipment, fit tested, and trained in the proper use of air-purifying respirators. Site personnel are required have their respirator available and ready to use onsite. Only respirators that are NIOSH/MSHA approved are to be used.

Air monitoring will be performed to assess airborne contaminant levels onsite, and to evaluate suitable respiratory protection. Workers will be required to wear half-face, air-purifying respirators with organic vapor cartridges under the following circumstances, as indicated by onsite air monitoring:

- If volatile organic compound (VOC) vapors in the work area continuously exceed the threshold limit value time-weighted average (TLV-TWA) for gasoline (300 parts per million [ppm]).
- If, at any time, VOC vapors in the work area exceed the threshold limit value short-term exposure limit (TLV-STEL) for gasoline (500 ppm).

TLV values for gasoline are derived from American Conference of Governmental Industrial Hygienists (ACGIH) standards. Similar precautions will be taken with regard to other toxic chemicals, such as BTEX components. See ATTACHMENT B for additional information and regulatory exposure limits.

7.3 REASSESSMENT OF PPE

The levels of protection listed above will be upgraded (or downgraded) based on changes in activities, changes in site conditions, measurements of direct-reading instruments (compared to action levels for contaminants), or other findings. Changes in the level of protection require the approval of the SSO.

8.0 AIR MONITORING

Monitoring will be conducted as needed to characterize airborne contaminant levels. The potential hazards associated with the presence of hydrocarbons include (1) personnel exposure to chemicals, and (2) possible formation of flammable atmospheres in and around the work area. Air sampling

will be conducted in accordance with NIOSH, OSHA, or EPA methods. The SSO will check to see that air monitoring equipment brought onsite is properly calibrated prior to operation and recalibrated during the course of the day, as necessary.

8.1 FLAME IONIZATION DETECTOR

A flame ionization detector (FID) will be used for the monitoring of VOCs in the work area in accordance with the requirements outlined in Title 8 CCR 5192. Air monitoring will be conducted in the breathing zone of workers, and the data collected will be used to evaluate suitable respiratory protection against chemicals encountered. Refer to the Respirator Selection guidelines in **Section 7.2** for personal protection measures. Measurements will also be obtained periodically at the top of boreholes or excavation cavities, and during any construction activities in which hydrocarbon-affected soil is encountered; however, only breathing zone measurements will be used to determine whether PPE should be used or discontinued.

8.2 COMBUSTIBLE GAS INDICATOR

A direct-reading, portable CGI that measures VOC concentrations in ppm, or as a percentage of the lower explosive limit (LEL), will be used to monitor airborne concentrations of VOCs and evaluate the possible formation of flammable atmospheres in and around the work area. Data will be used to monitor and evaluate vapor concentrations within or emanating from well bores, excavations, and contaminated soil that is stockpiled, moved, or loaded on or about the site. Measurements will be obtained periodically at the top of boreholes or excavation cavities throughout drilling or excavation operations, and during any construction activities in which hydrocarbon-affected soil is encountered. Periodic measurements also will be taken in areas that may contain an accumulation of combustible vapors.

In the event that CGI readings on the site exceed 10 percent of the LEL, work will be suspended, monitoring will be continued as needed to isolate the area of concern, and the following applicable environmental controls will be implemented:

- 1. Vapors from pooled petroleum product will be suppressed (if necessary) by spraying with foam, appropriate chemical suppressant, or carbon dioxide in gas form or dry ice.
- 2. Air movers will be used to ventilate the areas of concentration to below 10 percent LEL.
- 3. Contaminated soil will be covered with clean soil and/or sprayed with water or deodorizing chemicals in order to reduce vaporization of VOCs.

9.0 DECONTAMINATION

Due to the expected low levels and types of contaminants at the site, it is anticipated that personnel will not perform routine decontamination procedures when leaving the Exclusion Zone. Project activities will be initially conducted in Level D PPE. When decontamination is necessary, it will consist of the following:

- Removal of contaminated garments in an "inside out" manner at a designated decontamination station located at the step-off location where personnel routinely enter/exit the Exclusion Zone.
- Placement of contaminated garments in designated plastic bags or drums prior to disposal or transfer offsite. Labels in compliance with the hazard communication standard will be affixed to containers of contaminated debris and clothing.

10.0 PERSONNEL TRAINING

Personnel who will perform field activities shall meet the training requirements specified in the OSHA Hazardous Waste Operations and Emergency Response (HAZWOPER) Standard [29 CFR 1910.120 (e)]. Prior to commencement of work, the SSO will discuss the potential physical and chemical hazards associated with site operations, and review safe work practices with personnel. Personnel are required to acknowledge their understanding and willingness to comply with this SHSP before admission to the site by signing the Compliance Log at the end of the SHSP.

Other job-specific training required to perform tasks within this operation will be verified by the SSO. This training may include, but is not be limited to respirator fit testing, safe lifting techniques, confined spaces, hearing conservation, and proper fire fighting procedures.

11.0 MEDICAL PROGRAM

The site medical program has two main components: a baseline medical surveillance program, and emergency medical assistance procedures.

11.1 BASELINE MEDICAL SURVEILLANCE

Alton Geoscience has established a medical surveillance program to assess, monitor, and help protect the health of employees, in particular, employees who may be exposed to potentially hazardous substances during site work. Personnel will undergo medical examinations as follows:

Initial: Pre-employment / prior to any assignment involving work in a hazardous or potentially hazardous environment. The initial examination is used to establish a baseline picture of health against which future changes can be measured, and to identify any underlying illnesses or conditions that might be aggravated by chemical exposures or job activities.

Periodic: At least once every 12 months to measure changes in health status.

Upon notification: As soon as possible upon notification by an employee that they have developed signs or symptoms indicating possible overexposure to hazardous substances, or in response to an injury or exposure during an emergency situation.

Exit: At termination of employment.

11.2 EMERGENCY MEDICAL ASSISTANCE

An emergency medical assistance network will be established prior to work start-up. The nearest fire department, police, ambulance service, and hospital with an <u>emergency room</u> will be identified. See ATTACHMENT C for Emergency Services contact information. A vehicle shall be available onsite during work activities to transport injured personnel to the identified emergency medical facilities, if necessary. Company vehicles are to be equipped with a fire extinguisher and first aid kit.

12.0 EMERGENCY RESPONSE PLAN

The SSO will have controlling authority during an emergency. In the SSO's absence, the Alternate SSO will be in charge. See ATTACHMENT C for the name, location, and telephone number of emergency response organizations in the vicinity of the project site, and a map to the nearest hospital(s).

12.1 EMERGENCY PROCEDURES

In the event of an accident, injury, or other emergency, remember to:

Stop work and REMAIN CALM.

Move personnel to a safe location (evacuation plan).

Call 911 or notify other emergency facilities.

Address medical emergencies and apply first aid, if necessary.

Contain physical hazards. (NOTE: Act only if hazard is minimal and you are trained to deal with the situation. Otherwise evacuate and wait for emergency services to arrive.)

Notify offsite supervisor and client, and initiate accident reporting procedures.

12.2 ACCIDENT REPORTING

In case of an accident, the SSO (or Alternate) will immediately notify the Supervisor/Offsite Coordinator at the nearest Alton office and later provide a report to the PM describing the following:

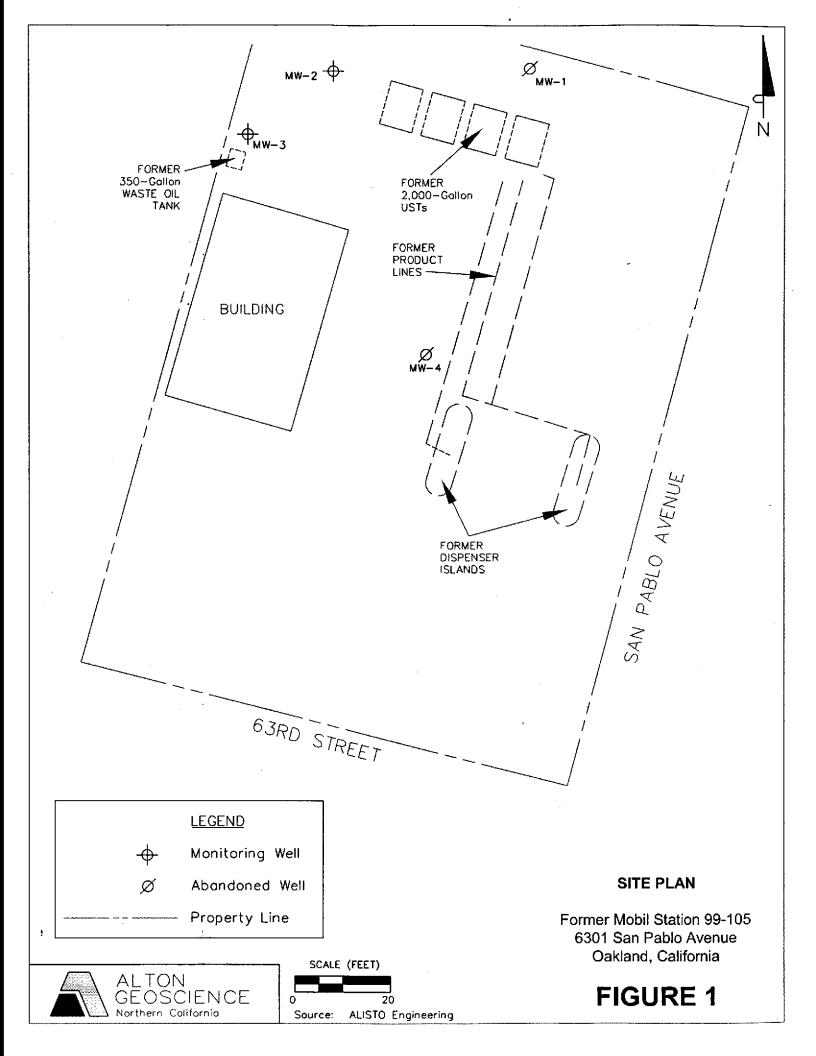

- 1. A description of the event (including date and time) that required notification of offsite personnel (i.e., medical facilities, fire department, police department) and the basis for that decision.
- 2. Date, time, and names of persons/agencies notified, and their response.
- 3. Details regarding personal injury and property damage, if any.
- 4. Resolution of incident and the corrective action involved.

All incidents and near misses are to be investigated in accordance with Alton's IIPP. The Supervisor's Report of Accident is to be completed and submitted to the Human Resources department within 24 hours following any accident or injury.

SITE HEALTH AND SAFETY PLAN COMPLIANCE LOG

I have reviewed this Site Health and Safety Plan and understand the contents of the plan. I hereby agree to comply with all safety requirements outlined herein.

ATTACHMENT B

OCCUPATIONAL HEALTH GUIDELINES AND TOXICOLOGICAL INFORMATION

Table B-1

OCCUPATIONAL HEALTH GUIDELINES AND TOXICOLOGICAL INFORMATION
Gasoline Constituents

Contaminant	ACGIH TLV-TWA (ppm)	NIOSH REL (ppm)	OSHA PEL (ppm)	STEL (ppm)	IDLH (ppm)	Routes of Exposure	Known or Suspected Carcinogen	Symptoms
Diesel (as Stoddard solvent)	for Diesel fuel/ Kerosene 14.4 (skin only)	Approx. 60-98	- 500	250-500 (NIOSH ceiling)	Approx. 3000- 5600	Inhalation, Ingestion Contact	No	Irritation to eyes, skin, mucous membrane; dermatitis, headache, fatigue, blurred vision dizziness, slurred speech, confusion, convulsions, aspiration, weakness, restlessness, incoordination
Gasoline	300	n/a	n/a	500 (ACGIH)	n/a	Inhalation, Absorption, Ingestion, Contact	Yes	Irritation to eyes, skin, mucous membrane; dermatitis, headache, fatigue, blurred vision, dizziness, slurred speech, confusion, convulsions, aspiration
Benzene	0.5	0.1	1	l (NIOSH)	500	Inhalation, Absorption, Ingestion, Contact	Yes	Irritation to eyes, skin, nose, resp system, giddiness, headache, nausea, staggered gait, fatigue, anorexia, weakness/exhaustion, dermatitis
Toluene	50	100	200	150 (NIOSH)	500	Inhalation, Absorption, Ingestion, Contact	No	Irritation to eyes, nose; fatigue, weakness, confusion, euphoria, dizziness, headache, dilated pupils, tears, nervousness, muscle fatigue, insomnia, dermatitis
Ethylbenzene	100	100	100	125 (NIOSH& ACGIH)	800	Inhalation, Ingestion, Contact	No	Irritation to eyes, skin, mucous membranes; headache, dermatitis, narcosis, coma
Xylenes (o.m.p.)	. 100	100	100	150 (NIOSH & ACGIH)	900	Inhalation, Absorption, Ingestion, Contact	No	Irritation to eyes, skin, nose, throat; dizziness, excitement, drowsiness, incoordination, staggering gait, nausea, vomiting, abdominal pain, dermatitis
Methyl tert butyl ether (MTBE)	40	n/a	n/a	n/a	n/a	n/a	n/a	n∕a

TABLE KEY

ACGIH TLV-TWA American Conference of Governmental Industrial Hygienists, Threshold Limit Value-Time

Weighted Average

NIOSH REL National Institute of Occupational Safety & Health, Recommended Exposure Limit

STEL Short Term Exposure Limit (Gasoline STEL is by ACGIH; BTEX STELs are by NIOSH)

OSHA PEL Occupational Safety and Health Administration, Permissible Exposure Limit

IDLH Immediately Dangerous to Life and Health

ppm parts per million
CNS Central Nervous System

n/a not available (i.e., no value has been established)

DEFINITIONS

Threshold Limit Value: Threshold limit values (TLVs) refer to airborne concentrations of substances and represent conditions under which it is believed nearly all workers may be repeatedly exposed, day after day, without adverse health effects.

Threshold Limit Value - Time Weighted Average: The time weighted average (TWA) is a concentration for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers may be repeatedly exposed, day after day, without adverse effect. TLV-TWAs are established by the ACGIH.

Recommended Exposure Limit: Unless otherwise noted, the recommended exposure limit (REL) is a TWA concentration for up to a 10-hour workday during a 40-hour workweek. RELs are established by NIOSH to reduce or eliminate adverse occupational health effects.

Short Term Exposure Limit: A short term exposure limit (STEL) is defined as a 15-minute TWA exposure that should not be exceeded at any time during a workday. When compared to the REL (or TLV-TWA for ACGIH standards), the STEL allows the worker to be exposed to a higher concentration, BUT for a shorter period of time. Exposures above the REL up to the STEL should not be longer than 15 minutes and should not occur more than four times per day.

Permissible Exposure Limit: Permissible exposure limits (PELs) are TWA concentrations that must not be exceeded during any 8-hour work shift of a 40-hour workweek. PELs are established by OSHA (29 CFR 1910.1000).

Immediately Dangerous to Life and Health: Immediately dangerous to life and health (IDLH) values are established as concentrations from which a worker can escape within 30 minutes without suffering loss of life, irreversible health effects, or other deleterious effects that could prevent him/her from escaping the hazardous environment. The purpose of establishing an IDLH exposure concentration is to ensure that workers can escape from a given contaminated environment in the event of failure of respiratory protection equipment.

LOCAL AREA MAP with routes to hospital

TAILGATE SAFETY MEETING CHECKLIST

	off as discussed)
·	Personnel training/qualifications: Check cards for OSHA HAZWOPER 40-hour certification/8-hour-refresher training (other if appropriate).
	Supplies: Indicate location of first aid kit, fire extinguisher, clean water supply (drinking, eye wash), and Site Health and Safety Plan (SHSP).
	Emergency services: Discuss location of nearest telephone and directions to hospital. Map, directions, phone numbers provided at end of SHSP (Attachment C).
	Site background: Discuss types, locations, and concentrations of chemicals found onsite, presence of free product, depth to groundwater, etc.
	Work activities: Discuss scope of work for the day and activities to be performed.
	Potential hazards: Discuss physical hazards (lifting, pinch points, traffic, working around machinery, etc.); chemical hazards (exposure limits, symptoms, air monitoring); and environmental hazards (heat stress, etc.).
	Air monitoring: Necessary equipment is onsite and calibrated. Circle: CGI PID
-	Personal protective equipment (PPE): Discuss required level of protection. See that workers have appropriate PPE onsite; includes, but is not limited to, hardhat, steel-toe boots, safety glasses, ear plugs / hearing protection, respirator (with cartridges), gloves, traffic safety vest (other).
	Utilities: Utilities have been cleared/marked by appropriate divisions.
	Traffic control (vehicular and pedestrian): Work area is properly delineated and cordoned off from traffic.
	Compliance log: SHSP has been reviewed and signed by site personnel.
