Subject: Horton Street Right-of-Way Extension
Emeryville, California

Dear Susan:

Enclosed for your review is a copy of SOMA's report entitled "Characterization and Remediation of PCB-Impacted Soils Beneath the Horton Street Right-of-Way Extension Between 59th and 62nd Streets Emeryville, California".

Thank you for your time in reviewing our report. If you have any questions or comments, please call me at (925) 244-6600.

Sincerely,

Mansour Sepehr, Ph.D., P.E.
Principal

Enclosure

1.0 INTRODUCTION

This report has been prepared by SOMA Environmental Engineering, Inc. (SOMA) on behalf of Viacom Inc. (Viacom) successor by corporate name change to CBS Corporation, formerly known as Westinghouse Electric Corporation. This report describes the activities performed during characterization and remediation of polychlorinated biphenyls (PCB) impacted soils at the Horton Street Extension corridor located at the western boundary of the Heritage Square Property located at 6121 Hollis Street, Emeryville, California (the "Property"), see Figure-1. The report also presents the analytical results of soil, water and air samples collected during the construction and remediation activities conducted at the Property.

The report also summarizes relevant worker's health and safety issues and describes the implementation of the recommended components of the risk management plan as described in SOMA's (2000) report entitled "Site Specific Risk Management Plan, for Construction Activities at EmeryStation II" dated March 17, 2000.

1.2 Background

Review of the historical aerial photos showed stockpiles of unidentified material and ground discoloration at the Heritage Square site from 1931 through 1950. In November 1950, ITT Grinnell Company (ITT) acquired the Heritage Square Property. Sometime between 1950 and 1959, ITT paved over the soil discoloration area. Currently, Wareham Development Group is the owner of the Property.

The Heritage Square parking lot is located immediately north of EmeryStation II, where elevated levels of PCBs were previously detected in the surface soils.

The Emery Station II property was formerly owned by Westinghouse Electric Company. The property has been used for a variety of purposes, including repair and limited manufacturing of transformers and other electric apparatus. Since 1981, a number of environmental investigations, soil excavation and removal and periodic groundwater monitoring have been performed to assess soil and groundwater quality conditions at the Site, particularly with respect to PCBs.

On June 23, 1998 at the request of Wareham Development, the current owner of Emery Station II, two composite soil samples and one groundwater sample were collected from the Property where excavations were being conducted to repair the parking lot pavement. The samples were analyzed for PCBs and total petroleum hydrocarbons using U.S. EPA Methods 8080 and 8015 Modified.

On June 28, 1998, in accordance with an agency approved work plan, SOMA drilled eight soil borings along the inside of the Property's southern boundary. Figure 2 shows the location of the - soil borings. Soil borings were drilled by hollow stem auger to a maximum depth of 5 feet, and soil samples were collected at 0.5 foot and 4 feet below ground surface (bgs). The samples were analyzed for PCBs using U.S. EPA Method 8080.

On July 10, 1998, two discrete confirmatory soil samples were collected at 2 and 4 feet bgs around the open excavation in the parking lot. The soil samples were submitted to Priority Laboratory of Santa Clara for analysis using U.S. EPA Method 8080.

The results of soil investigations in the Heritage Square property did not indicate the presence of elevated levels of PCBs in soil samples collected from eight shallow soil borings. The concentration of PCBs as Aroclor 1260 in soil samples collected from the eight soil borings ranged between non-detect and 3.8 mg/kg. The concentration of Aroclor 1260 in the two composite soil samples collected

from the excavation in the parking lot adjacent to the northern property line of the Emery Station II facility ranged from 4.1 and 136 mg/kg. The 136 mg/kg Aroclor 1260 concentration was detected in the shallow composite soil sample (collected from between 0 to 2 feet bgs) while the 4.1 mg/kg concentration was detected in the deep composite soil sample (collected from between 2 to 4 feet bgs). Two confirmatory discrete soil samples did not confirm the elevated levels of Aroclor 1260 concentration around the open pit area. The concentrations of Aroclor 1260 in the two discrete soil samples were 3.5 and 7.0 mg/kg. The concentration of PCBs in the groundwater sample collected from the open pit was 0.132 mg/L.

In January-February 2000, in response to the Alameda County Department of Environmental Health's (ACDEH) request to delineate the extent of PCB-impacted soils in Heritage Square, SOMA drilled 25 shallow soil borings (up to four feet) and collected soil samples at 0.5 and 4-foot depth intervals. Figure 3 shows the locations of these borings, which are labeled SB-1 through SB-25. The results of the laboratory's analysis of these soil samples revealed elevated levels of PCB concentrations beneath the Property. PCB concentrations at 0.5-foot bgs ranged from 1.2 mg/kg to 2,760 mg/kg. The concentration of PCB at 4-foot bgs ranged between non-detectable (ND) to 1,990 mg/kg. Although the results of the January-February 2000 field investigation revealed the presence of elevated levels of PCBs at the Property, it failed to delineate the horizontal extent of PCB-impacted soils at Heritage Square.

On May 10, 2000, SOMA submitted a recommendation for conducting additional investigations to ACDEH (SOMA, May 10, 2000). On June 20, 2000, ACDEH approved SOMA's recommendations for conducting additional investigations for complete delineation of the extent of PCB-impacted soils at the Site.

On June 24, 2000, an additional field investigation was conducted by SOMA for delineation of PCB-impacted soils. During this period a total of 22 additional soil

borings were drilled and sampled at 0.5 and 3.5-foot depth intervals. The soil samples were analyzed by Delta Environmental Laboratories of Benicia, California. Figure-3 shows the location of these soil borings, which are labeled SB-26 through SB-47. The results of this investigation revealed the lateral extent of PCB contamination at 0.5 and 3.5-4 feet below ground surface. The result of this investigation revealed that the majority of near surface soils just below the asphalt have been impacted by PCBs. For instance, 23 out of 47 soil samples collected from 0.5-foot depth interval contained more than 50 mg/kg PCBs, generally Aroclor 1260. Figures 4 and 5 show the distribution of PCB concentration at 0.5-foot and 3.5-foot depth intervals, respectively.

In late 2000, the City of Emeryville acquired the western portion of the Heritage Square parking lot in order to extend Horton Street between 59th and 62nd Streets. Per construction reports, the width of the street right-of-way was 46 feet, and the maximum excavation depth for utilities was 8-feet below the ground surface (bgs). In addition, utility trenches including storm, sanitary, electric, gas and telephone lines were installed under the roadway, which run from EmeryStation II north to 62nd Street. Figure-6 shows the location of the Horton Street Extension and the location of the utility trenches as built in the subsurface.

For the remediation phase of the Horton Street Extension construction SOMA was retained by Viacom to assist in segregation of heavily PCB-impacted soils (greater than 50 mg/kg) with that of less impacted soils (less than 50 mg/kg). In addition, SOMA was involved in the implementation of components of the risk management plan during construction

SOMA's report entitled "Delineation of the Extent of PCBs Contamination at the Heritage Square Property Located at 6121 Hollis Street, Emeryville, California" dated August 28, 2000 includes the horizontal and vertical (up to 3.5 feet) delineation of PCBs distribution within the Heritage Square parking lot.

Viacom retained WRS, Infrastructure & Environmental, Inc. (WRS) to perform the excavation and remediation of the Horton Street Extension while SOMA was involved with segregation of PCB-impacted soils for proper disposal and implementation of the components of risk management plan as requested by the ACDEH.

2.0 SCOPE OF WORK

The scope of work included the following:

- 1) Preparation of Health and Safety Plan
- 2) Conducting Additional Soil Investigation
- 3) Implementation of Mitigation Measures during Construction
- 4) Post Excavation and Remediation Soil Investigation

Following is a brief description of the above-mentioned tasks:

2.1 Preparation of Health and Safety Plan

To ensure the health and safety of the construction worker involved with excavation, removal and transportation of PCB-impacted soils the health and safety plans (HASP) prepared by SOMA for EmeryStation II were implemented during the recent activities. In addition, a site-specific health and safety plan was prepared by WRS to address all known aspects of construction-related activities associated with the Property. The HASP was designed to address safety provisions during field activities. It provides procedures to protect field crew from physical and chemical hazards resulting from drilling, and soil and groundwater sampling. The HASP established personnel responsibilities, general safe work practices and field procedures, personal protective equipment standards, decontamination procedures, and emergency action plans.

2.2 Conducting Additional Soil Investigation

The previous soil borings for vertical delineation of PCB concentrations at the Property did not advance deeper than 3.5-4 feet bgs. The maximum depth of the borings (4 feet) was selected based on the provisions of the risk assessment document, which assumes that no exposure pathway exists beneath the four feet depth. The results of the laboratory analyses of soil samples collected at 0.5 and 3.5 foot depths indicated that the vertical extent of the PCBs in the southern portion of the planned Horton Street Extension is beyond the sample depth of 3.5 feet. The maximum depth of soil samples collected for evaluation of the extent of PCB contamination at the Heritage Square Property in the summer of 2000 was approximately 3.5 feet. At the 3.5 foot depth, PCB contamination was detected at a maximum concentration of 1,990 mg/kg at the southern portion of the Horton Street Extension. However, at the central and northern end of the Horton Street Extension, minor (less than 2.5 mg/kg) concentrations of PCBs were detected at the 3.5-foot depth. In order to evaluate the vertical extent of the PCBs at the southern end of the Horton Street right-of-way and document the nature of other chemicals, if any in the subsurface, 8 soil borings were drilled to a maximum depth of 8 feet. The locations of these borings are indicated on Figure-7 and coincide with the location of the proposed sanitary and storm drain lines, which were excavated up to eight feet in depth. Analytical results obtained from these samples were used to characterize the soils for disposal purposes at TSCA and Class II non-hazardous landfill facilities.

On October 15, 2000, the soil borings were drilled using a hollow stem auger. Soil samples were collected using brass tubes at 0.5, 4, and 8-foot depth intervals. Both ends of the brass tubes containing soil samples were covered with Teflon tape and secured with plastic caps and insulation tape. The soil samples were placed in an ice chest and delivered to Delta Environmental Laboratories. To avoid cross contamination, the sampling tools were

decontaminated after drilling and sampling of each soil boring. A total of 24 soil samples were collected during this investigation. The soil samples were analyzed for PCBs using U.S. EPA Method 8080. In addition, for profiling purposes required by the landfills, the soil samples were also analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and heavy metals, using U.S. EPA Methods 8260, 8270, and 7000/6010, respectively. The analytical results of this investigation are tabulated in Table-1 through Table-3.

Table 1 presents the analytical results of the soil samples using EPA Method 8260. Benzene with a maximum concentration of 1,000 $\mu\text{g}/\text{kg}$ was only detected in SB-6 at a depth of 4 feet. Soil boring SB-7 was the only borehole that showed non-detectable levels of VOC concentrations. As Table-1 shows, the soils in the vicinity of SB-4 through SB-6 were significantly impacted with VOCs. As Table 1 shows, most of the detected chemicals were accumulated at a depth of 4 feet in SB-4 and SB-6. SB-5 and SB-6 exhibited elevated levels of VOCs at 0.5-foot depth interval. For instance, at SB-5, 1,3-dichlorobenzene, 1,4-dichlorobenzene and 1,2,4-trichlorobenzene were detected at maximum concentrations of 48,000, 36,500 and 77,000 $\mu\text{g}/\text{kg}$, respectively at the 0.5-foot depth interval. In addition, 1,2,4-trichlorobenzene was also detected at a concentration of 85,500 $\mu\text{g}/\text{kg}$ at SB-6 location at the 0.5-foot depth interval.

The analytical results of soil samples for Cam 17 metals using EPA Methods 7000/6010 are presented in Table 2. All metal concentrations in all soil borings were below the acceptable levels by the class II landfills. The exceptions were lead concentrations in SB-5 and SB-7 at depths of 0.5 and 4-feet respectively. However, the results of the analyses for the Solubility Threshold Limit Concentration (STLC) on SB-5 and Toxicity Characteristic Leaching Procedures (TCLP) on SB-7 samples were 1.9 mg/L and less than 0.5 mg/L, respectively. Therefore, the STLC and TCLP analyses results satisfied the requirements of

Waste Management, Inc. for disposal of chemically impacted soils in their Class I and Class II landfills.

The analytical results of soil samples using EPA Methods 8270, 5030/GCFID and 8080 are summarized and presented in Table 3. No semi-volatile organic compounds (SVOCs) were detected in soil samples analyzed by EPA Method 8270. However, low levels of 1,2-Dichlorobenzene, 1,4-Dichlorobenzene and 1,2,4-Trichlorobenzene were detected in soil samples using EPA Method 8270. Since the same chemicals were detected using EPA Method 8260, they are not included in Table-3 (see Table-1). The concentration of TPH-g ranged between less than the laboratory detection limit of 0.05 mg/kg and 187 mg/kg. PCB as Aroclor-1260 was found in six out of 8 boring locations with the maximum concentration of 1,480 mg/kg in SB-5 at a depth of 0.5-feet.

On November 13, 2000, before initiation of remediation activities for road construction purposes, Wareham removed surface obstacles such as trees, curbs and planters, which facilitated the excavation and remediation operations. In addition, Wareham secured the Heritage Square parking lot by fencing off the portion of the property, to provide enough space for stockpiling and hauling off the waste soils following the excavation and testing of the stockpiled soils. The City of Emeryville approved Horton Street Extension construction plans, for planning and implementation of the construction and remediation activities.

2.3 Implementation of Mitigation Measures

All elements of the risk management plan at EmeryStation II were implemented according to SOMA's standard operation procedure set forth in our March 17, 2000 report entitled "Implementation of Site-Specific Risk Management Plan During The Pile Cap Excavation at EmeryStation II".

This section presents the general measures that were implemented to mitigate potential impacts to human health and the environment during the excavation activities. Specifically, mitigation of the following potential impacts will be discussed:

- Dust control during the excavation and loading activities;
- Air quality monitoring for tracking soil particulate containing PCBs;
- Protection of manholes of the existing storm drain system in order to prevent transportation of the chemically-impacted site sediments in surface water runoff;
- Protection of groundwater monitoring wells;
- Management of groundwater extracted during construction activities (dewatering activities);
- Use of protective clothing;
- Ventilation and air quality control inside the wastewater storage tank during the cleaning operation.

2.3.1 Dust Control

As discussed in detail in the Site Health and Safety Plan, the generation of dust was controlled in order to minimize:

- 1) potential exposures of on-site construction workers; and
- 2) the migration of airborne particulates to off-site areas.

Dust control measures included the following:

- Use of water spray or mist during excavation and vehicle loading;
- Limiting the maximum vehicle speed on-site to 5 miles per hour;

- Minimizing the drop heights during loading of the transportation vehicles and covering the whole loading area with plastic sheeting; and
- Covering the stockpiled soil with plastic sheeting or tarps to prevent wind erosion.

Appendix A shows the photographs of dust control activities conducted by WRS under the supervision of SOMA's senior field staff.

2.3.2 Air Monitoring

The potential off-site exposures to PCBs/particulates were monitored using fenceline sampling. Three mobile air monitoring stations were set up at different locations of the fence lines surrounding the site to represent the quality of air passing over the site into neighboring properties. In addition, on one occasion one of the air monitoring stations was installed inside the loader cabin during loading of the excavated soils to the dump trucks. Table-8 presents the date and locations of the air monitoring stations during each monitoring event. Table-9 shows the results of laboratory analyses on air samples collected during soil excavation and removal processes.

During the excavation and loading activities, due to the wet weather conditions, dust generation was extremely low. Therefore, air monitoring and sampling events were limited to four occasions. The collected air samples were sent to Quanterra Incorporated Laboratories in Sacramento for analysis using EPA Method "TO-10/8082" for PCBs. Appendix B includes laboratory reports and chain of custody forms. As shown in the laboratory reports, no PCBs were detected in any of the air samples collected during these monitoring events.

Appendix A shows pictures of the air monitoring devices used for air sampling purposes during the construction/remediation activities of the Horton Street extension.

2.3.3 Storm Water Pollution Controls

There were three manholes for the existing storm drain system at the Site. Before starting the excavation activities, storm water pollution controls were implemented. Even though most of the construction activities took place below grade, on-site sediment and erosion protection controls were implemented, which included:

- During the rainy days the gates were kept closed to trucks and heavy machinery in order to prevent off-site migration of soil containing chemicals;
- Covering the manholes using burlap and straws;
- Blocking the open end of the recently installed storm drainpipe with Hazrob® spill control pillows.
- Covering the stockpiled soil with plastic sheeting or tarps.

Appendix A shows photographs of precautionary measures for protection of the storm drainage system.

2.3.4 Dewatering Activities

Most of the construction activities took place below the watertable, necessitating the removal of purged groundwater for dewatering of the excavated trenches. All groundwater encountered during the excavation period were pumped and stored on-site in a 20,000-gallon storage tank for appropriate disposal at an off-site facility. During rainfall events, some run-off water entered into the excavation trenches, which were then pumped and transferred into the storage tank. Prior to disposal of the purged groundwater and storm water, a representative water

sample from the storage tank was collected and delivered to Curtis & Tompkins Laboratory for analysis. Appendix B shows the laboratory reports and chain of custody forms. As the reports show, non-detectable levels of PCBs and petroleum hydrocarbons were found in the collected sample.

Appendix A shows pictures of the dewatering activities and the storage tank used to store the purged groundwater and storm water runoff at the Site. After characterization of the contents of the tank, Cameron Environmental Inc., a subcontractor of SOMA, disposed of the contents of the storage tank in a permitted off-site location. Appendix E shows the wastewater manifests. Based on the waste manifests, a total of 17,750 gallons of purged groundwater and storm water runoff was disposed of at an off-site location.

2.3.5 Protection of Groundwater Monitoring Wells

There were six shallow and six deep groundwater monitoring wells in the former service yard of the Westinghouse facility, as shown in Figure 8. In the northeast corner of Emery Station II, monitoring wells S-6 and D-6 no longer exist. Apparently, these two wells were destroyed during previous construction activities. The exact location of these destroyed wells are unknown. Monitoring wells S-4 and D-4 are located southeast of the slurry wall. Monitoring wells S-5 and D-5 are located in the northwestern portion of Emery Station II at the far southwest corner of the excavated area of the newly constructed Horton Street extension. During the construction of the sanitary sewer system, by relocating the south manhole of the sewer system northward, these two wells were protected. These wells will remain as a part of the long-term groundwater monitoring program overseen by EPA Region IX to evaluate the effectiveness of the slurry wall.

2.3.6 Decontamination

Construction equipment and transportation vehicles that contacted Site soils containing residual contamination were decontaminated prior to leaving the Site in order to minimize the potential for off-site migration. Prior to loading the stockpiled soil for off-site disposal, the trucks were driven onto a large sheet of plastic. Following loading, dirt was removed from the vehicle exterior and wheels and captured by the plastic sheeting. Appendix A shows pictures of the precautionary measures conducted during the truck loading of the contaminated soils at the Site.

2.3.7 Personal Protective Equipments

Based on the previous experience during excavation/construction activities at Emery Station II, during excavation/remediation activities at Horton Street extension, modified Level-D protection was found to be adequate.

3.0 APPLICABLE SOIL PCBs CLEANUP LEVELS

The recommended PCB cleanup levels in SOMA's (1996) human health risk document for different land use scenarios were used as soil cleanup criteria. Table-10 shows the cleanup criteria for different land use scenarios as recommended by SOMA (1996) for the upper two feet of soil. From 2 to 4 feet bgs, the apartment dwelling scenario applies.

Therefore, the clean-up criterion for PCBs from 0-2 feet depths was 2.85 mg/kg and from 2-4 feet was 59.3 mg/kg. Initially, the top 18-inch including asphalt pavement with the underlying soils were excavated and disposed of. Then, the soils between 2 and 4 feet depth intervals containing more than 50 mg/kg PCBs were segregated (using PCB screening kits in the field) and disposed of in a Class I landfill.

Per construction drawings, the utility lines, including sewer and storm drains and PG&E trench were installed at a maximum depth of 6 - 8.5 feet. The utility lines ran from Emery Station II in an east-west direction toward the Horton Street Extension and then ran in a south-north direction beneath Horton Street Extension toward 62nd Street. Figure-6 shows the location of utility trenches. The maximum depth of soil excavation for construction and installation of utility trenches did not exceed 8.5 feet bgs. The excavated soils containing over 50 mg/kg PCBs did not return into the trenches, instead after field screening with respect to PCB content they were hauled off and depending upon the PCB levels disposed in Class I or Class II landfill facilities. A detailed description of the excavation of utility trenches is described below.

4.0 EXCAVATION AND SOIL REMOVAL ACTIVITIES

The following is a description of the excavation activities, which were conducted in late 2000 and early 2001 as part of the Horton Street Right-of-Way Extension.

4.1 Excavation of the Sanitary Sewer Line

On November 16, 2000 excavation of the sanitary sewer was started from the middle of 62nd street. Because the main sewer line in the middle of 62nd was at a depth of 8 feet, the northern end of the Horton Street Extension required excavation of up to 8 feet bgs. In order to ensure the safety of construction workers and to prevent collapsing of the excavation pits, proper shoring was used along the edges of the excavation at the limits of the proposed street extension.

During the excavation process, SOMA's Site Safety Officer (SSO) conducted soil screening tests using a PCB kit called "Clor-N-Soil". This soil screening test kit allowed segregation of the soils containing greater than 50 mg/kg PCBs from the soils containing less than 50 mg/kg. The soils containing greater than 50 mg/kg

were disposed of at the TSCA facility in Kettleman Hills, California. The soils containing less than 50 mg/kg were disposed of at the Altamont Landfill facility. Appendix C includes the soil disposal manifests. Additionally, soil screening test kits were used to assist the field crew for rapid assessment of residual PCBs concentration beneath the excavation. Using such test kits reduced the costs and expedited the cleanup process.

4.2 Confirmatory Sampling of the Sewer Trench

On November 28, 2000, after excavation of the sewer trench to the final sub-grade elevations, in areas of known deeper contamination, confirmatory soil samples were collected from the bottom and walls of the trench to document the concentration of residual levels of PCBs. The locations of these confirmatory soil samples are shown in Figure 9, and the depths of sampling and the analytical results are presented in Table 4. PCBs as Aroclor-1260 were found in all samples in the range of 0.12 mg/kg and 2,500 mg/kg.

4.3 Excavation of PG&E Storm Drain and Water Hydrant Trenches

The excavation of the PG&E storm drain and water hydrant trenches was started from the north curb of 62nd street, on November 28, 2000, December 12, 2000, and January 4, 2001, respectively. The maximum depths of these trenches were 5 and 8 and 5 feet below ground surface, respectively. The safety precautions and soil screening procedures followed during excavation of these trenches were the same as described during the installation of the sewer system, above.

4.4 Laboratory and Field Tests of the Insulator Materials

During the excavation of the southern section of the Horton Street Extension, adjacent to the Emery Station II, it was found that the whole area to a depth of 6-7 feet bgs was backfilled with a large amount of electrical insulators and other

electrical components. The chemical analysis of a sample collected from the insulators, confirmed the mineral nature of these insulators, with the main constituent being calcium sulfate. However, the analysis also revealed elevated concentrations of PCBs up to 2,520 mg/kg (see Table 7). To determine whether the PCBs were physically or chemically associated with the insulators, on January 8, 2001, further tests were conducted. On this day, five samples of the insulators were collected from different locations in the sewer drain trench. Then, all of the adhered external materials (soils?) were removed from the insulators using a sharp knife. All external materials were mixed and a composite sample was prepared. The composite sample was delivered to Delta for PCB analysis. The findings of the laboratory analysis are tabulated in Table 7. The laboratory analysis did not indicate elevated levels of PCBs in insulators without coating (only 0.20 mg/kg of PCBs was reported). Therefore, it was concluded that the PCBs externally adhere to the insulators, and the insulators themselves are not chemically composed of PCBs.

4.5 Excavation of Top Two Feet of Horton Street

After installation of pipes and utility lines, the excavated trenches were backfilled with one-foot thick rock or sand material and then filled with cement slurry to a depth of 2 feet below ground surface. Then, based on the approved workplan, on December 28, 2001, excavation of the top 2 feet of the entire area began from the south end of Horton Street. Due to the presence of the large amount of insulators, at the southern portion of the entire site for an approximate length of 110 feet, the City of Emeryville required that an additional 0.5-foot of material be excavated from this area. The excavated soils were stockpiled and tested using the PCB screening kits. In general, the soils in this area were found to be impacted with high levels of PCBs (greater than 50 mg/kg). The excavation of the top 2 feet was finished on January 6, 2001 but hauling and transportation of soils continued until January 9, 2001.

5.0 FURTHER CHARACTERIZATION OF SUBSURFACE SOILS

After removing the soils up to a 2.5-foot depth, further soil investigation was conducted to evaluate PCB concentrations between the 2 to 4-foot depth intervals. This study was conducted to comply with the recommendation of SOMA 1996 risk assessment document. As was explained in Section 3.0 above, per SOMA's risk assessment recommendation, the PCBs cleanup level for soils between 2 and 4-foot depth intervals was 59.5 mg/kg. Additional soil sampling was conducted from January 11 through January 22, 2001. The soil samples were tested using the field screening test kits. Based on the results of field screening tests the soils between the 2 and 4 feet depths interval containing greater than 50 mg/kg PCBs were excavated and disposed of in a Class I landfill facility. Using 50 mg/kg as a soil cleanup level is more stringent than the recommended levels in SOMA (1996) document. Table-5 shows the results of field screening tests using PCB test kits.

After removing the soils containing more than 50 mg/kg PCBs, confirmation sampling was conducted to document the remaining residual concentration of PCBs at the 3 and 4 foot depth intervals. Table-6 shows the results of the laboratory analysis of soil samples collected after excavation and removal of PCB-impacted soils. As Table-6 indicates, elevated levels of PCBs at a 4-foot depth remained in placed per SOMA (1996) risk assessment recommendation. Only soils between the 2 and 4 foot depth intervals were removed and disposed of at the Class I disposal facility.

STL SACRAMENTO PROJECT NUMBER: G0L080222
PO/CONTRACT:

Mansour Sepehr
SOMA Environmental Engineering
2680 Bishop Drive
Suite 203
San Ramon, CA 94583

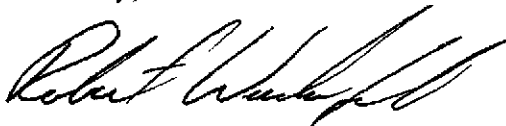

Dear Mr. Sepehr,

This report contains the analytical results for the samples received under chain of custody by STL Sacramento on 12/8/00.

The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916)374-4333.

Sincerely,

Robert Weidenfeld
Project Manager

AIR, TO-10, PCBs

The samples in this lot were received at 11 degrees C.

There were no other anomalies associated with this project.

STL Sacramento
Quality Control Definitions

QC Parameter	Definition
QC Batch	A set of up to 20 field samples plus associated laboratory QC samples that are similar in composition (matrix) and that are processed within the same time period with the same reagent and standard lots.
Duplicate Control Sample (DCS)	Consist of a pair of LCSs analyzed within the same QC batch to monitor precision and accuracy independent of sample matrix effects. This QC is performed only if required by client or when insufficient sample is available to perform MS/MSD.
Duplicate Sample (DU)	A second aliquot of an environmental sample, taken from the same sample container when possible, that is processed independently with the first sample aliquot. The results are used to assess the effect of the sample matrix on the precision of the analytical process. The precision estimated using this sample is not necessarily representative of the precision for other samples in the batch.
Laboratory Control Sample (LCS)	A volume of reagent water for aqueous samples or a contaminant-free solid matrix (Ottawa sand) for soil and sediment samples which is spiked with known amounts of representative target analytes and required surrogates. An LCS is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects.
Matrix Spike and Matrix Spike Duplicate (MS/MSD)	A field sample fortified with known quantities of target analytes that are also added to the LCS. Matrix spike duplicate is a second matrix spike sample. MSs/MSDs are carried through the entire analytical process and are used to determine sample matrix effect on accuracy of the measurement system. The accuracy and precision estimated using MS/MSD is only representative of the precision of the sample that was spiked.
Method Blank (MB)	A sample composed of all the reagents (in the same quantities) in reagent water carried through the entire analytical process. The method blank is used to monitor the level of contamination introduced during sample preparation steps.
Surrogate Spike	Organic constituents not expected to be detected in environmental media and are added to every sample and QC at a known concentration. Surrogates are used to determine the efficiency of the sample preparation and the analytical process.

CASE NARRATIVE

STL SACRAMENTO PROJECT NUMBER G1A080137

AIR, TO-10, PCBs

The samples in this lot were received at 9 degrees C.

The surrogate recovery for the DCB surrogate in these three samples is high and above Targeted limits. The surrogate recoveries in the associated MB and LCS were within QC limits. This condition is most likely due to matrix effects. There is a visible interference peak co-eluting with the DCB surrogate. The TCX surrogate is within control limits in each of these samples. A high surrogate recovery indicates that there could be a high bias in reporting the analytes of interest. Since all samples are ND for all target analytes there is no adverse impact to the data quality. It should also be noted that per the method, only one surrogate is required to be in control.

There were no other anomalies associated with this project.

STL Sacramento
Quality Control Definitions

QC Parameter	Definition
QC Batch	A set of up to 20 field samples plus associated laboratory QC samples that are similar in composition (matrix) and that are processed within the same time period with the same reagent and standard lots.
Duplicate Control Sample (DCS)	Consist of a pair of LCSs analyzed within the same QC batch to monitor precision and accuracy independent of sample matrix effects. This QC is performed only if required by client or when insufficient sample is available to perform MS/MSD.
Duplicate Sample (DU)	A second aliquot of an environmental sample, taken from the same sample container when possible, that is processed independently with the first sample aliquot. The results are used to assess the effect of the sample matrix on the precision of the analytical process. The precision estimated using this sample is not necessarily representative of the precision for other samples in the batch.
Laboratory Control Sample (LCS)	A volume of reagent water for aqueous samples or a contaminant-free solid matrix (Ottawa sand) for soil and sediment samples which is spiked with known amounts of representative target analytes and required surrogates. An LCS is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects.
Matrix Spike and Matrix Spike Duplicate (MS/MSD)	A field sample fortified with known quantities of target analytes that are also added to the LCS. Matrix spike duplicate is a second matrix spike sample. MSs/MSDs are carried through the entire analytical process and are used to determine sample matrix effect on accuracy of the measurement system. The accuracy and precision estimated using MS/MSD is only representative of the precision of the sample that was spiked.
Method Blank (MB)	A sample composed of all the reagents (in the same quantities) in reagent water carried through the entire analytical process. The method blank is used to monitor the level of contamination introduced during sample preparation steps.
Surrogate Spike	Organic constituents not expected to be detected in environmental media and are added to every sample and QC at a known concentration. Surrogates are used to determine the efficiency of the sample preparation and the analytical process.

CASE NARRATIVE

STL SACRAMENTO PROJECT NUMBER G1B080203

The samples in this lot were received at 4 degrees C.

AIR, TO-10, PCBs

The East Fenceline sample was labeled as South Fenceline.

There were no other anomalies associated with this project.

STL Sacramento
Quality Control Definitions

QC Parameter	Definition
QC Batch	A set of up to 20 field samples plus associated laboratory QC samples that are similar in composition (matrix) and that are processed within the same time period with the same reagent and standard lots.
Duplicate Control Sample (DCS)	Consist of a pair of LCSs analyzed within the same QC batch to monitor precision and accuracy independent of sample matrix effects. This QC is performed only if required by client or when insufficient sample is available to perform MS/MSD.
Duplicate Sample (DU)	A second aliquot of an environmental sample, taken from the same sample container when possible, that is processed independently with the first sample aliquot. The results are used to assess the effect of the sample matrix on the precision of the analytical process. The precision estimated using this sample is not necessarily representative of the precision for other samples in the batch.
Laboratory Control Sample (LCS)	A volume of reagent water for aqueous samples or a contaminant-free solid matrix (Ottawa sand) for soil and sediment samples which is spiked with known amounts of representative target analytes and required surrogates. An LCS is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects.
Matrix Spike and Matrix Spike Duplicate (MS/MSD)	A field sample fortified with known quantities of target analytes that are also added to the LCS. Matrix spike duplicate is a second matrix spike sample. MSs/MSDs are carried through the entire analytical process and are used to determine sample matrix effect on accuracy of the measurement system. The accuracy and precision estimated using MS/MSD is only representative of the precision of the sample that was spiked.
Method Blank (MB)	A sample composed of all the reagents (in the same quantities) in reagent water carried through the entire analytical process. The method blank is used to monitor the level of contamination introduced during sample preparation steps.
Surrogate Spike	Organic constituents not expected to be detected in environmental media and are added to every sample and QC at a known concentration. Surrogates are used to determine the efficiency of the sample preparation and the analytical process.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.
