Mr. Dave Charter
State Water Resources Control Board
Underground Storage Tank (UST) Cleanup Fund Program
P.O. Box 944212
Sacramento, CA 94244-2120

Re: UST Fund Cost Pre-approval Request Remedial Excavation and Reporting

Former Signal Oil Service Station #20-6145 (S-800) 800 Center Street Oakland, California UST Claim #12265

Dear Mr. Charter,

On behalf of Chevron Environmental Management Company (Chevron), Cambria Environmental Technology, Inc. (Cambria), has prepared the following *Cost Pre-Approval Requests* for the above referenced site. These requests include the estimated costs for soil profiling, well destruction, remedial excavation, and the installation of replacement wells.

If you have any questions regarding these pre-approval requests, please do not hesitate to call me at (510) 420-3349.

Sincerely,

Cambria Environmental Technology, Inc.

John Ortega

Senior Staff Scientist

COST ESTIMATE

Remedial Excavation Activities

Client: Chevron Environmental Management Company (Chevron)

Site: 800 Center Street, Oakland, California

Project No.: 31J-2002

2006 Remedial Excavation

Cambria will conduct remedial excavation activities as approved by Alameda County Environmental Health Care Services Agency (ACEHCSA). Site remedial excavation activities will include the destruction of four onsite monitoring wells, a soil profiling investigation, soil disposal, groundwater disposal, installation of up to four monitoring wells, and preparation of a Remedial Excavation Report. This work is summarized below:

Task 1 - Soil Profiling and Well Destruction: As per Cambria's agency-approved work plan dated May 23, 2006, Cambria will advance eight borings to profile soil for disposal and to further define the extent of hydrocarbons prior to the proposed remedial excavation. Borings will be advanced to approximately 20 feet below grade (fbg) using hydraulic push technology. Discrete soil samples will be collected at approximately 10, 15, and 19.5 fbg and submitted for laboratory analysis of TPHg, BTEX and MTBE. Three 4-point composite samples will be collected and submitted for analysis of TPHg, BTEX, MTBE and Lead. In addition, to prevent damage to onsite monitoring wells during excavation activities, MW-1A, MW-2, MW-3 and MW-7 will be properly destroyed using a 10-inch hollow-stem auger. Profiling activities will include preparation a Site Heath and Safety Plan, permitting, marking the site for USA, and scheduling a drilling contractor.

Task 2 - Remedial Excavation: As per Cambria's agency-approved work plan dated November 17, 2005, Cambria proposes to remove residual hydrocarbons prior to development of the site by excavating soil and pumping and treating groundwater. Because the collapsing power lines will be de-energied during installation and removal of shoring. A tree located on the southwest corner of the site will be removed prior to the installation of shoring. Once shoring is in place, an excavating contractor will mobilize equipment and start the soil removal process. Approximately and the contraction of shoring is in place, an excavating contractor will mobilize equipment and start the soil removal process. Approximately and the contraction of shoring is in place, an excavating contractor will mobilize equipment and start the soil removal process. Approximately and the contraction will be pump out, treated through temporary remediation system and disposed to the sanitary sewer under an approved discharge permit from the East Bay Municiple sewer district and the City of Oakland. A traffic control contractor will provide traffic control plan and temporary traffic control to guide vehedular and pedestrian traffic. Prefield activities will consist of preparation a Site Heath and Safety Plan.

Task 3 - Well installation: Once all remedial excavation activities have been completed, Cambria, as required in the ACEHCSA May 25, 2006 work plan approval letter, will install up to four monitroing wells to replace those wells that were destroyed before the start of the excavation. The well(s) will be installed using 10-inch diameter hollow-stem augers to a depth of approximately 30 fbg. Soil samples will be collected for lithologic description and laboratory analysis of TPHg, BTEX, and MTBE. Soil cuttings and rinse water generated during drilling activities will be temporarily stored onsite in 55-gallon DOT-approved steel drums pending disposal. Following installation, a surveyor will be contracted to survey the new wells. Pre-field activities will consist of preparation of a Site Heath and Safety Plan, well permitting, marking the site for USA, and scheduling a drilling contractor.

Task 4 - Remedial Excavation Report: Cambria will prepare a Remedial Excavation Report following the completion of excavation activities. The report will include descriptions of excavation activities, laboratory analytical results, soil boring logs and well destruction details, figures depicting all boring and sample locations, disposal methods and manifests, discussion of the hydrocarbon distribution in soil and groundwater, and an estimate of the remaining hydrocarbon mass within the subsurface.

Task 5 - Well Installation Report: Cambria will prepare a Well Installation Report following the completion of well installation and quarterly groundwater sampling activities. The report will include descriptions of drilling activities, tabulated analytical results, soil boring logs and well construction details, figures depicting the location of all wells, groundwater gradient, hydrocarbon concentrations in soil and groundwater, hydrogeologic cross-sections, laboratory reports, disposal methods and manifests, discussion of the hydrocarbon distribution in soil and groundwater, and an estimate of the remaining hydrocarbon mass within the subsurface.
