**Subject:** **Quarterly Groundwater Monitoring Report**  
**Fourth Quarter, 2009**  
807 75th Avenue  
Oakland, California  
AEI Project No. 262157  
ACHCS # RO 0508

Dear Mr. Kanady:

AEI Consultants (AEI) has prepared this report to document the results of the second quarter 2009 groundwater monitoring event at the above referenced site (Figure 1: Site Location Map). This groundwater investigation has been performed in accordance with the requirements of the Alameda County Health Care Services Agency (ACEH). The purpose of this activity is to monitor groundwater quality near the location of previously removed underground storage tanks (USTs) at the site. This report presents the findings of the 4th Quarter 2009 groundwater monitoring event, performed on December 11, 2009.

### **Site Description and Background**

The site is located in an industrial area of the City of Oakland, on the northern corner of the intersection of 75<sup>th</sup> Avenue and Snell Street, just east of San Leandro Street. The property is approximately 10,000 square feet in size and currently developed with two buildings, and is occupied by Omega Termite.

On September 15, 1996, AEI removed three (3) gasoline USTs from the subject property. The tanks consisted of one 8,000-gallon UST, one 1,000-gallon UST, and one 500-gallon UST. The former locations of the tanks are shown on Figure 2. Soil and groundwater samples collected during the tank removal activities revealed that a release had occurred from the tank system. Total petroleum hydrocarbons as gasoline (TPH-g), benzene, and methyl tertiary butyl ether (MTBE) were detected in the soil samples at concentrations up to 4,300 mg/kg, 13 mg/kg, and 25 mg/kg, respectively.

In October 1997, soil and groundwater samples were collected from six (6) soil borings (BH-1 through BH-6). In June 1999, four (4) groundwater monitoring wells (MW-1 through MW-4) were

also installed by AEI. The construction details for the groundwater monitoring wells on site are summarized in Table 1. Monitoring well locations are shown on Figure 2. Historical groundwater elevation and historical groundwater sample analytical data are presented in Tables 2 and 3.

Under the direction of the ACEH, additional soil was removed from the excavation in March 2000. The excavation was extended to 29 by 48 feet in size and 8 feet deep at the east end of the excavation and 11.5 at the west end. During the excavation activities, an additional 500-gallon UST was discovered at the eastern end of the excavation. This tank was removed under the direction of Oakland Fire Services Agency (OFSA). Six additional soil samples were collected from the sidewalls and bottom of the excavation.

The resulting excavation was then backfilled with pea gravel to bridge the water table, with the remainder of the excavation being filled with the previously aerated soil and later with imported fill. The newly excavated soil was stockpiled on the northern portion of the property. A total of 7,400 gallons of hydrocarbon-impacted groundwater were pumped from the excavation, treated on-site, and discharged to the sanitary sewer system under an East Bay Municipal Utility District permit.

On October 9 and 10, 2003, AEI drilled seven (7) temporary Geoprobe® boreholes (SB-7 through SB-13) to depths ranging from 15 to 20 feet bgs to further delineate the lateral extent of contamination in the Shallow aquifer. One borehole, SB-14 was advanced to a depth of 30 feet bgs to determine if the second aquifer at the site had been impacted. Soil samples were collected in the vadose zone above the first aquifer and from the aquitard between the first and second aquifers. The results of chemical analyses of soil samples collected and analyzed during this investigation and earlier investigations appear to have effectively defined the limits of impacted soil in the vadose zone.

The analysis of the water sample from the second aquifer (Soil Boring SB-14, 28 feet bgs) reported TPH-g, TPH-d, MTBE and benzene at concentrations of 2,300 µg/L, 72,000 µg/L, 45 µg/L and 120 µg/L, respectively. Light non-aqueous phase liquid was observed on the sampler and in the water sample.

On February 15 and February 16, 2006, AEI advanced five soil borings (MW-6 through MW-10) on the site, and completed the borings as groundwater monitoring wells. The Monitoring wells were drilled with a Marl 2.5 D drilling rig. Shallow Zone well MW-6 and Deeper Zone wells MW-7 through MW-10, were drilled with nominal 8-inch diameter hollow stem augers and completed as 2" groundwater monitoring wells. The details of the well completions are summarized in Table 1.

These and existing wells were sampled on March 13, 2006. Maximum concentrations of TPH-g, TPH-d, and TPH-mo reported from the Shallow Zone were 3,200 µg/L (MW-1), 2,400 µg/L (MW-2), and 320 µg/L (MW-1), respectively. The maximum concentrations of benzene reported was 1,400 µg/L in MW-1.

Maximum concentrations of TPH-g, TPH-d, and TPH-mo reported from the Deeper Zone were 1,100 µg/L, 14,000 µg/L, and 4,100 µg/L, respectively in MW-9 with the notation of light

immiscible hydrocarbons present in the sample. The maximum concentration of benzene reported was 85 µg/L in MW-9. The results of this investigation are summarized in “*Deeper Aquifer Soil and Groundwater Investigation Report*”, dated April 28, 2006.

In a letter dated May 25, 2006, the ACEH requested a work plan for installation and pilot testing of the ozone sparging system recommended by AEI. The “*Well and Ozone Micro-Sparge System Installation Work Plan*” was approved by the ACEH in a letter dated August 11, 2006. The Ozone Micro-Sparge System was installed during February and March with initial start up on march 8, 2008. Ozone system installation, start up and monitoring activities are summarized in “*In Situ Ozone Oxidation Install and Startup Report*”, date January 30, 2008

## Geology and Hydrology

The site is located at an elevation approximately 11 feet above mean sea level (msl). The site is essentially flat; however, the general topography of the area slopes gently to the west. The surface sediments at the site are mapped as Holocene natural levee and basin deposits (Qhl and Qhb, OF 97-97, E.J. Helley and R.W. Graymer). The Natural Levee Deposits (Holocene) are described as “loose, moderately to well-sorted sandy or clayey silt grading to sandy or silty clay”. The Basin Deposits (Holocene) are described as “very fine silty clay to clay deposits occupying flat-floored basins at the distal edge of alluvial fans adjacent to the bay mud (Qhbm)”. The presence of gravels in several of the onsite soil borings indicates that stream channel deposits are also present.

Based on the soil borings advanced by AEI, the near surface sediments beneath the site can be divided into several water bearing zones which are separated by clay layers. Sediments immediately below the surface consist of black to gray brown to olive brown silty clay depths ranging from 7.5 to 10 feet bgs. No groundwater was encountered during drilling of this interval.

The surface clay is underlain by variable and somewhat discontinuous silty sand and clayey silt, which make up the Shallow Zone. The Shallow Zone extends from the base of the surface clay to depths ranging from 18 to 21 feet bgs. This zone has low to medium permeability. Groundwater is typically seen in the first permeable silt or sand encountered during drilling of this interval. Once encountered, groundwater level typically stabilizes at a depth of 5 feet bgs or less, indicating the zone is at least a semi-confined aquifer.

The Shallow Zone is underlain by several feet of moderately dry light olive brown to yellowish brown clay, except in MW-7, drilled through the former tank hold, below which the clays have significant discoloration (dark greenish gray clay).

At depths ranging from 18 ft (MW-9) to 21 feet (MW-8) bgs, a second discontinuous water bearing zone (Intermediate Zone) is present. The Intermediate Zone consists of discontinuous gravel, clayey gravel, and silty sand, clayey sand, and clayey silt which are interbedded with clay layers. Permeability in the Intermediate Zone ranges from high (gravel) to poor (clayey silt). The Intermediate Zone is separated from the Deeper Zone by a layer of brown silty clay that ranges in thickness of 2 to 7 feet.

A third water bearing zone (Deeper Zone) was encountered at a depth of approximately 27 to 28 feet bgs. The lower permeable zone is made up of clayey silt, clayey sand, clean sand and sandy gravel.

### **Summary of Activities**

The ozone injection system was turned off on August 28, 2009 to determine if groundwater contamination concentrations would rebound following system shutdown. AEI conducted monitoring, and quarterly groundwater sampling of five (5) Shallow Zone monitoring wells (MW-1 through MW-4 and MW-6) and six (6) Deeper Zone wells (MW-7 through MW-12) on December 11, 2009.

Prior to measuring the depth to water, the well caps were removed and the water levels in each well were allowed to equilibrate with atmospheric pressure for at least 15 minutes. The depth to groundwater (from the top of the well casings) for each well was then measured with an electric water level indicator. A peristaltic pump was used to purge all wells on site. Wells MW-1 through MW-6 were purged with the sampling tubing at a depth of approximately 12 feet below ground surface (bgs) and wells MW-7 through MW-12 were purged with the sampling tubing at a depth of approximately 27 feet bgs. During purging activities, the groundwater parameters: temperature, pH, specific conductivity, dissolved oxygen (DO), and oxidation-reduction potential (ORP) were measured. A visual evaluation of turbidity was made and noted. Groundwater parameters measured in the field are reported on the field sampling forms included in Appendix A.

Following stabilization of groundwater parameters, groundwater samples were collected using the peristaltic pump bailers and placed into 40-milliliter (ml) Volatile Organic Analysis (VOA) vials and 1-liter amber bottles. The VOAs were filled so that no headspace or air bubbles were visible within the sample containers. Samples were transported in a cooler on ice under appropriate chain-of-custody protocol to McCampbell Analytical, Inc. of Pittsburg, California (Department of Health Services Certification #1644).

Groundwater samples from the wells were analyzed for TPH-g, MTBE, benzene, toluene, ethyl benzene, xylenes (MBTEX), by SW8021B/8015Cm, and TPH-d (as diesel) and TPH-mo (as motor oil) by SW8015C.

### **Field Results**

Groundwater elevations in the Shallow Zone monitoring wells ranged from 6.22 (MW-1) to 6.37 (MW-3) feet above mean sea level (amsl). These elevations in the Shallow Zone are an average of 0.24 feet higher than at the time of the previous quarterly monitoring event. The groundwater hydraulic gradient in the Shallow Zone is 0.0047 ft/ft to the southwest.

Groundwater elevations in the Deep Zone monitoring wells ranged from 6.12 (MW-) to 6.90 (MW-8) feet amsl. These elevations are an average of 0.06 feet lower than at the time of the previous

quarterly monitoring event. The groundwater hydraulic gradient in the Deep Zone is 0.033 ft/ft to the south-southeast.

Current and historical groundwater elevation data are summarized in Tables 3 and 3a. The groundwater elevation contours and the groundwater flow directions are presented in Figure 3 and Figure 4. Groundwater Monitoring Well Field Sampling Forms are presented Appendix A.

## Groundwater Quality

TPH-g and TPH-d concentrations in Shallow Zone monitoring well MW-1 decreased to 91 µg/L and 170 µg/L, respectively. BTEX was reported as non-detectable at a reporting limit of 0.5 µg/L, with the exception of toluene reported at 1.3 µg/L. MTBE and TPH-mo were reported as non-detectable at reporting limits of 5.0 µg/L and 250 µg/L, respectively.

The TPH-g concentration in Shallow Zone monitoring well MW-2 decreased to 330 µg/L, while TPH-d remained constant to 120 µg/L. Toluene, ethylbenzene, and total xylenes were reported at 5.9 µg/L, 1.0 µg/L, and 0.72 µg/L, respectively. Benzene was reported at non-detectable at a reporting limit of 0.5 µg/L. MTBE and TPH-mo were reported as non-detectable at reporting limits of 5.0 µg/L and 250 µg/L, respectively.

The TPH-g, TPG-d, TPH-mo, and MTBE concentrations in Shallow Zone monitoring wells MW-3 through MW-6 remained below standard reporting limits, with the exception of MTBE reported in MW-6 at 5.3 µg/L. BTEX was reported as non-detectable at a reporting limit of 0.5 µg/L in these wells.

TPH-g, TPH-d, TPH-mo, MTBE, and BTEX, concentrations in Deeper Zone monitoring wells MW-7 and MW-8 remained below standard laboratory detection limits.

The TPH-g concentration in Deeper Zone monitoring well MW-9 decreased to 52 µg/L. TPH-d remained ND<50 µg/L. BTEX decreased to below standard reporting limit of ND<0.5. MTBE and TPH-mo remained below reporting limits of 5.0 µg/L and 250 µg/L, respectively.

The TPH-g, TPH-d, TPH-mo, MTBE, and BTEX concentrations reported in wells MW-10, MW-11, and MW-12 remained, below standard reporting limits, with the exception of TPH-g reported in MW-10 at 55 µg/L.

A summary of groundwater analytical data is presented in Table 2 and Figure 5. TPH-g contaminant isolopleths of the Shallow and Deeper Zone wells is presented in Figures 6 and 7, respectively. Laboratory results and chain of custody documents are included in Appendix B.

## Summary

The Fourth Quarter 2009 monitoring event follows a period of approximately 100 days during which the ozone injection system has been shut down. Overall hydrocarbon concentrations in all wells with detectable hydrocarbons have decreased.

Total Petroleum Hydrocarbons, BTEX and MTBE concentrations in all Deeper Zone wells (MW-8, through MW-12) are below RWQCB ESLs for groundwater that is a current or potential drinking water resource.

With the exception of MW-2, Total Petroleum Hydrocarbons, BTEX and MTBE concentrations in all Shallow Zone wells are below RWQCB ESLs for groundwater that is a not a current or potential drinking water resource.

AEI recommends changing the monitoring period to quarterly monitoring to confirm that rebound is not occurring and that the site has reached the point where it can be considered for closure under commercial/industrial guidelines.

## Report Limitations and Signatures

This report presents a summary of work completed by AEI Consultants, including observations and descriptions of site conditions. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide required information, but it cannot be assumed that they are entirely representative of all areas not sampled. All conclusions and recommendations are based on these analyses, observations, and the governing regulations. Conclusions beyond those stated and reported herein should not be inferred from this document.

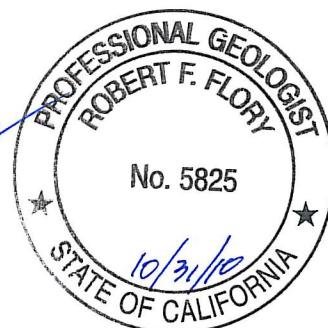

These services were performed in accordance with generally accepted practices in the geologic, environmental engineering and construction fields that existed at the time and location of the work.

Please contact Robert F. Flory at (925) 944-2899 extension 122, if you have any questions regarding the findings and recommendations included in this report.

Sincerely,  
AEI Consultants

Adrian M. Angel, GIT  
Staff Geologist

Robert F. Flory, P.G.  
Senior Geologist

Average water table elevation calculated using Microsoft Excel

Shallow Zone Wells: MW-1, MW-2, MW-3, MW-4, MW-6

Deeper Zone Wells: MW-7, MW-8, MW-9, MW-10, MW-11, MW-12

## **APPENDIX A**

### **MONITORING WELL FIELD SAMPLING FORMS**

**AEI CONSULTANTS**  
GROUNDWATER MONITORING WELL FIELD SAMPLING FORM

**Monitoring Well Number:** MW-1

Project Name:	Omega Termite (Q4, 2009)	Date of Sampling:	12/11/2009
Job Number:	262157	Name of Sampler:	A Nieto
Project Address:	807 75th Avenue Oakland		

**MONITORING WELL DATA**

Well Casing Diameter (2"/4"/6")	2
Wellhead Condition	OK
Elevation of Top of Casing (feet above msl)	10.68
Depth of Well	20.00
Depth to Water (from top of casing)	4.46
Water Elevation (feet above msl)	6.22
Well Volumes Purged	Micropurge
Actual Volume Purged (liters)	3.0
Appearance of Purge Water	Clear
Free Product Present?	No
	Thickness (ft): NA

**GROUNDWATER SAMPLES**

Number of Samples/Container Size				2 - 40ml VOAs, 1 L Amber			
Time	Vol Removed (liters)	Temperature (deg C)	pH	Conductivity ( $\mu\text{S}/\text{cm}$ )	DO (mg/L)	ORP (meV)	Comments
	0.0	16.97	5.70	1029	10.51	-47.2	Clear
	1.0	17.61	5.57	1044	1.73	-50.9	Clear
	1.5	17.81	5.60	1050	1.20	-53.4	Clear
	2.0	18.00	5.64	1056	0.80	-57.7	Clear
	3.0	18.01	6.65	1056	0.74	-58.8	Clear

**COMMENTS (i.e., sample odor, well recharge time & percent, etc.)**

Clear, slight hydrocarbon odor

**AEI CONSULTANTS**

**WorkOrder: 0912333**

December 18, 2009

Dear Robert:

Enclosed within are:

- 1) The results of the **11** analyzed samples from your project: **#262157; Omega Termite**,
- 2) A QC report for the above samples,
- 3) A copy of the chain of custody, and
- 4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing  
McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius  
Laboratory Manager  
McCampbell Analytical, Inc.

### Chain of Custody (COC) Information

- Chain of custody present? Yes  No
- Chain of custody signed when relinquished and received? Yes  No
- Chain of custody agrees with sample labels? Yes  No
- Sample IDs noted by Client on COC? Yes  No
- Date and Time of collection noted by Client on COC? Yes  No
- Sampler's name noted on COC? Yes  No

### Sample Receipt Information

- Custody seals intact on shipping container/cooler? Yes  No  NA
- Shipping container/cooler in good condition? Yes  No
- Samples in proper containers/bottles? Yes  No
- Sample containers intact? Yes  No
- Sufficient sample volume for indicated test? Yes  No

### Sample Preservation and Hold Time (HT) Information

- All samples received within holding time? Yes  No
- Container/Temp Blank temperature Cooler Temp: 3.6°C NA
- Water - VOA vials have zero headspace / no bubbles? Yes  No  No VOA vials submitted
- Sample labels checked for correct preservation? Yes  No
- Metal - pH acceptable upon receipt (pH<2)? Yes  No  NA
- Samples Received on Ice? Yes  No

(Ice Type: WET ICE )

\* NOTE: If the "No" box is checked, see comments below.

0912333-011B	12/11/09 11:35 AM	12/11/09	12/12/09 3:46 AM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 \* (MS-Sample) / (Amount Spiked); RPD = 100 \* (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

DHS ELAP Certification 1644

 QA/QC Officer

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 \* (MS-Sample) / (Amount Spiked); RPD = 100 \* (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

<sup>f</sup> TPH(btex) = sum of BTEX areas from the FID.

# cluttered chromatogram; sample peak coelutes with surrogate peak.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = matrix interference and/or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content, or inconsistency in sample containers.
