**SUBJECT: SUBMITTAL OF QUARTERLY GROUNDWATER MONITORING REPORT,  
WEYERHAEUSER PAPER COMPANY, ALAMEDA CORRUGATED BOX FACILITY,  
1801 HIBBARD STR., STID 1202**

Dear Ms. Shin,

West & Associates Environmental Engineers, Inc. respectfully submits the second quarter 1995 groundwater monitoring report for the Weyerhaeuser Paper Company, Alameda Corrugated Box Facility. This report is submitted in accordance with the interim groundwater monitoring plan proposed in our Site Investigation Report of January 1995.

We expect to soon be authorized by the Weyerhaeuser Corporation to develop a proposal for remediation by excavation. We are hopeful such a project could be completed before the onset of winter.

We look forward to your review of our quarterly report. Should you require any additional information please contact me at (707) 451-1360.

Yours truly,

*Brian W. West*

## EXECUTIVE SUMMARY

The Weyerhaeuser Paper Company (WPC) Alameda facility at 1801 Hibbard Str. manufacturers corrugated cardboard boxes. The facility was originally constructed in 1946. Underground fuel tanks had been historically installed at the facility for vehicle, generator and boiler fuel storage. Both gasoline and diesel fuels were formerly stored underground. The last remaining underground tank was removed from the WPC site in January 1994.

The WPC facility is located on Alameda island in San Francisco Bay. The site is less than 0.25 miles west of the Oakland Inner Harbor. Site soils are predominantly sand with minor clay stringers. Unconfined groundwater is 3-6 feet below ground surface and tidally influenced.

There are two separate areas of groundwater monitoring at the WPC Alameda site. One monitoring well (MW-7) is located at the east end of the property adjacent to a former diesel tank installation. Ten monitoring wells are located near the west end of the property surrounding a former gasoline tank cluster. Monitoring wells MW-1 through MW-7 were installed by Soil Tech Engineers. Monitoring wells MW-9 through MW-12 were installed by West & Associates.

Site investigation at the WPC Alameda facility was concluded in January 1995 with the submittal of a comprehensive report covering all work dating back to 1990. Activity at the site has now shifted to remedial action. Pilot tests are currently being performed to determine the most appropriate course of remedial action.

Pending startup of full scale remedial action, an interim groundwater monitoring program is in effect at the WPC Alameda site. Groundwater monitoring, which consists of depth to groundwater measurements and collection of groundwater samples for analysis, is conducted quarterly.

## ACKNOWLEDGEMENTS

This report was prepared under authorization of the Weyerhaeuser Corporation, Office of the Environment, Toxic/Solid Waste Team, Tacoma, Washington. The Weyerhaeuser project officer is Ms. Jennifer Strachan, mail stop CH 1K29, Tacoma, WA 98477; (206) 924-6511.

At the WPC plant, both Mr. John Hipner, Plant Engineer and Mr. Tom Muncell, Maintenance Manager, have environmental compliance responsibilities related to this project. The Alameda plant address is 1801 Hibbard Street, PO Drawer X, Alameda, CA 95601; (510) 814-1167.

The lead regulatory agency for the Weyerhaeuser Alameda plant is the Alameda County Health Care Agency, Department of Environmental Health. Ms. Juliet Shin, Hazardous Materials Specialist, is the staff person assigned. The Department of Environmental Health is located at 1131 Harbor Bay Parkway, Suite 250, Alameda, CA 94502-6577; (510) 567-6700.

In the preparation of this quarterly report reliance was made on past site work performed by Soil Tech Engineering, Inc. Mr. Frank Hamedi was the Soil Tech Engineering employee most closely associated with the Weyerhaeuser Alameda site. The address for Soil Tech Engineering is 298 Brokaw Road, Santa Clara, CA 95050; (408) 496-0265.

Analytical work performed for this quarters monitoring was subcontracted to Pace Analytical in Petaluma. Pace is certified by the State Department of Health Services for the analyses performed.

This quarterly groundwater monitoring report was prepared by West & Associates Environmental Engineers, Inc. West & Associates is located at 112 Pepperell Court, Vacaville, CA 95688; mailing address, PO Box 5891, Vacaville 95696; (707) 451-1360. Principal author is Mr. Brian W. West PE. (Registered California Civil Engineer No. 32319 - expires 12/31/96).

## 1.0 INTRODUCTION

This quarter, groundwater monitoring was performed on May, 17 1995. During the groundwater sampling, all eleven of the existing monitoring wells were inspected for the presence of floating product, measured for depth to groundwater and sampled for chemical analysis.

In the following Sections, monitoring procedures are described, monitoring data is summarized and a discussion of results is presented. Technical data is included in the appendix.

### 1.1 Scope

The scope of this project included performing quarterly groundwater monitoring at Weyerhaeuser Paper Company (WPC) Alameda property, 1801 Hibbard Str., in Alameda. Figure 1 illustrates the WPC Alameda regional setting. Figure 2 depicts the site location. Specific scope items include:

- Check eleven existing monitoring wells for floating product
- Measure depth to groundwater in all monitoring wells
- Determine the groundwater gradient profile
- Collect groundwater samples from all eleven monitoring wells
- Analyze groundwater samples for contaminants of interest
- Prepare a written report of findings
- Properly manage sampling residues

### 1.2 Summarized Background

The Weyerhaeuser Paper Company (WPC) Alameda facility at 1801 Hibbard Str. manufacturers corrugated cardboard boxes. The facility was originally constructed in 1946. Underground fuel tanks (UGT) had been historically installed at the facility for vehicle, generator and boiler fuel storage. Both gasoline and diesel fuels were formerly stored. The last remaining UGT was removed from the WPC site in January 1994.

At the end of 1990 the WPC facility was equipped with five underground fuel storage tanks. The five tanks were distributed in three separate installations located along the northwestern side of the facility.

In early 1991 Weyerhaeuser removed a cluster of three, 1,000 gallon gasoline tanks and one, 10,000 gallon diesel tank. Upon removal, the 10,000 gallon diesel tank installation was found to be virtually uncontaminated, however, significant soil and groundwater contamination was encountered at the gasoline tank cluster location.

The tank removal contractor performed overexcavation at the gasoline tank cluster location in an attempt to remediate soil contamination. Between February and April 1991 the tank excavation was enlarged from 460 ft<sup>2</sup> to 640 ft<sup>2</sup> and then to 930 ft<sup>2</sup>.

Four soil samples were collected from the gasoline tank cluster pit sidewalls at the conclusion of overexcavation. Only one endpoint sidewall soil sample (Sample No. 11) was non-detectable for all tested chemical constituents. One of the sidewall soil samples (Sample No. 9) was found to contain only trace levels of toluene. The other two endpoint soil samples (Sample No.'s 8 & 10), were found to contain low levels of TPH and BTXE compounds.

During the time the gasoline tank cluster excavation was open, the standing groundwater level in the pit was observed to rise from greater than 8 feet to less than 4 feet below ground surface. As the pit water level rose, presumably overexcavation became more difficult. The file record indicates endpoint soil samples were collected from higher on the pit sidewalls as the water level rose.

Both the gasoline tank cluster and diesel tank excavations were backfilled with clean soil. Contaminated soil was transported to off-site disposal.

In December 1991 and again in April 1992, Soil Tech Engineering performed soils and groundwater investigations near the former gasoline tank cluster. A total of six groundwater monitoring wells were installed. Soil samples for laboratory analysis were collected during monitoring well installation. Between December 1991 and July 1993 Soil Tech performed groundwater monitoring on six occasions.

In December 1992, Soil Tech constructed one monitoring well (MW-7) adjacent to the former underground diesel tank, increasing the total number of site wells to seven. STE monitored MW-7 a total of 3 times.

Soil Tech's investigations revealed significant remaining soil contamination as well as widespread groundwater contamination in the vicinity of the former gasoline tank cluster. The six soil borings and monitoring wells completed by STE did not fully define the total extent of either soil or groundwater contamination around the former gasoline tank cluster.

In January 1994 the last remaining underground fuel storage tank, (20,000 gallon diesel) was removed from the WPC property. No evidence of any leakage from the diesel tank was encountered, however, soil contamination from the 1991 gasoline tank cluster was observed on the west sidewall of the diesel tank pit.

West & Associates Environmental Engineers submitted a proposed workplan for additional site investigation to the Alameda County Health Care Agency in November 1993. Site investigations were performed in January and February 1994. In May 1994 a supplemental workplan was submitted to conduct further investigation under the main plant building. In June 1994 an interim report of findings was submitted and in October 1994 clarifications to the May supplemental workplan were submitted to the County. Final site investigation field work took place in September and December 1994.

## 2.0 FLOATING PRODUCT

This quarter, each monitoring well was visually inspected for the presence of floating product. Prior to well purging, a column of groundwater was bailed from the water surface in a transparent bailer suitable for capture of light hydrocarbons.

No floating product or sheen was detected in any of the groundwater wells inspected this quarter. No floating product has been observed in any WPC Alameda wells on previous monitoring occasions.

## 3.0 GROUNDWATER SAMPLING

A quantity of groundwater is purged from each monitoring well prior to collecting a sample for chemical analysis. A description of equipment and procedures employed for groundwater purging and sample collection is presented in the following paragraphs.

### 3.1 Sampling Protocol

All the WPC Alameda monitoring wells are equipped with a 0.5 inch OD polyethylene tube extending the full depth of the well. Well purging is accomplished by attaching an Accuwell PTP-150 peristaltic pump at the well head to draw groundwater from the well. This procedure eliminates the need for any downhole equipment.

As groundwater is extracted from the well, 20ml samples are periodically collected for measurement of pH, temperature and conductivity using a Hydac instrument. Groundwater data is recorded on purge data forms (presented in the Appendix). At the conclusion of purging, the well is allowed to recharge to at least 80% of its initial water level prior to sample collection.

Purge water is contained in 55 gallon drums during the sampling process. At the conclusion of sampling, purge water drums are sealed, labeled and stored on-site in a secure area pending chemical analysis and arrangements for proper disposal.

Groundwater sample collection is performed by lowering a new, disposable, bailer into the well. Sample water is transferred to a laboratory supplied 40 ml VOA bottle containing a suitable preservative. The sample bottles are only opened during sample transfer, are completely filled and are not re-opened again by field personnel.

All samples are immediately labeled, sealed in zip lock bags and placed in a cooler containing crushed ice. The samples remain chilled, sealed and undisturbed during transport to the testing laboratory, usually within no more than 48 hours. All samples are entered on a chain of custody form which accompanies the sample set at all times.

Chemical analyses was performed by Pace Inc. in Petaluma. Pace is certified by the Department of Health Services for the analyses performed.

Quality assurance and quality control measures include:

- Utilizing State WQCB approved sampling methods
- Assigning trained, experienced personnel for sample collection
- Utilizing laboratory supplied sample containers
- Employing extraction methods not requiring downhole equipment
- Using new, disposable bailers
- Sampling wells sequentially from cleanest to most contaminated
- Maintaining sample chain of custody documentation
- Keeping samples in a chilled state until laboratory delivery
- Storing suspected high concentration samples in a separate container
- Prompt delivery of the sample set to the testing laboratory
- Utilizing a DHS certified laboratory

### 3.2 Sample Analyses

Each groundwater sample except MW-7 was analyzed for Total Petroleum Hydrocarbons in the gasoline range (TPH-g). Groundwater from monitoring well MW-7 was analyzed for TPH in the diesel range. As per an Alameda County Health Care Services Agency request, groundwater samples were also analyzed for chlorinated hydrocarbons (EPA method 624) and wells MW-2 & MW-3 were sampled for naphthalene (EPA 625). Due to a mis-communication with the testing laboratory, however, no analysis for xylenes was performed this quarter.

All analyses were performed using EPA approved test methods. Minimum detection limits for all analyses were within Tri-regional guidelines and are indicated on each original laboratory report form.

This quarters analytical results for TPH-g and BTXE contamination is presented in Table 1. Analysis of groundwater sample MW-7 detected 6.1 mg/l of TPH-d. Solvent contamination results are presented in Table 2. Results of semi-volatile (naphthalene) analysis are presented in Table 3. Copies of original laboratory data sheets and chain of custody forms are presented in the appendix.

### 3.3 Conclusions

The spatial distribution of gasoline contamination has not appreciably changed from last quarter. The magnitude of gasoline contamination in samples collected this quarter has fluctuated within the range previously observed at the site.

Results of this quarters groundwater sample chemical analyses with respect to solvent contamination is consistent with previous monitoring cycles. The extent and magnitude of solvent contamination has not significantly changed since routine monitoring began in February 1994.

Detectable concentrations of TPH-diesel were found in monitoring well MW-7 this quarter. The concentration of TPH-d detected this quarter is similar to concentrations detected in previous quarters.

#### 4.0 HYDROLOGIC MONITORING

Depth to groundwater (DTGW) was measured in all eleven of the WPC Alameda monitoring wells on May 17, 1995 this quarter. DTGW was measured using a Solinst electronic sounding meter. Measurement accuracy was +/- 0.01 feet.

Table 4 presents depth to groundwater measurements (DTGW) and groundwater elevations (GW) as measured on May 17, 1995. The change in groundwater elevation in each well relative to most recent previous measurement (March 7, 1995) is also indicated in Table 4.

Figure 3 illustrates groundwater contours under the site extrapolated from the May 17, 1995 groundwater elevation data. The groundwater gradient direction measured this quarter has a definite northerly orientation. Groundwater gradient direction fluctuations have been observed at the WPC site previously, however the gradient direction usually been more westerly.

#### ABBREVIATIONS

TOC: Top of Casing

DTGW: Depth to Groundwater

GWE: Groundwater Elevation

NA: Not Available

<sup>1</sup> Relative to last available DTGW measurement: March 7, 1995

#### 4.1 Conclusions

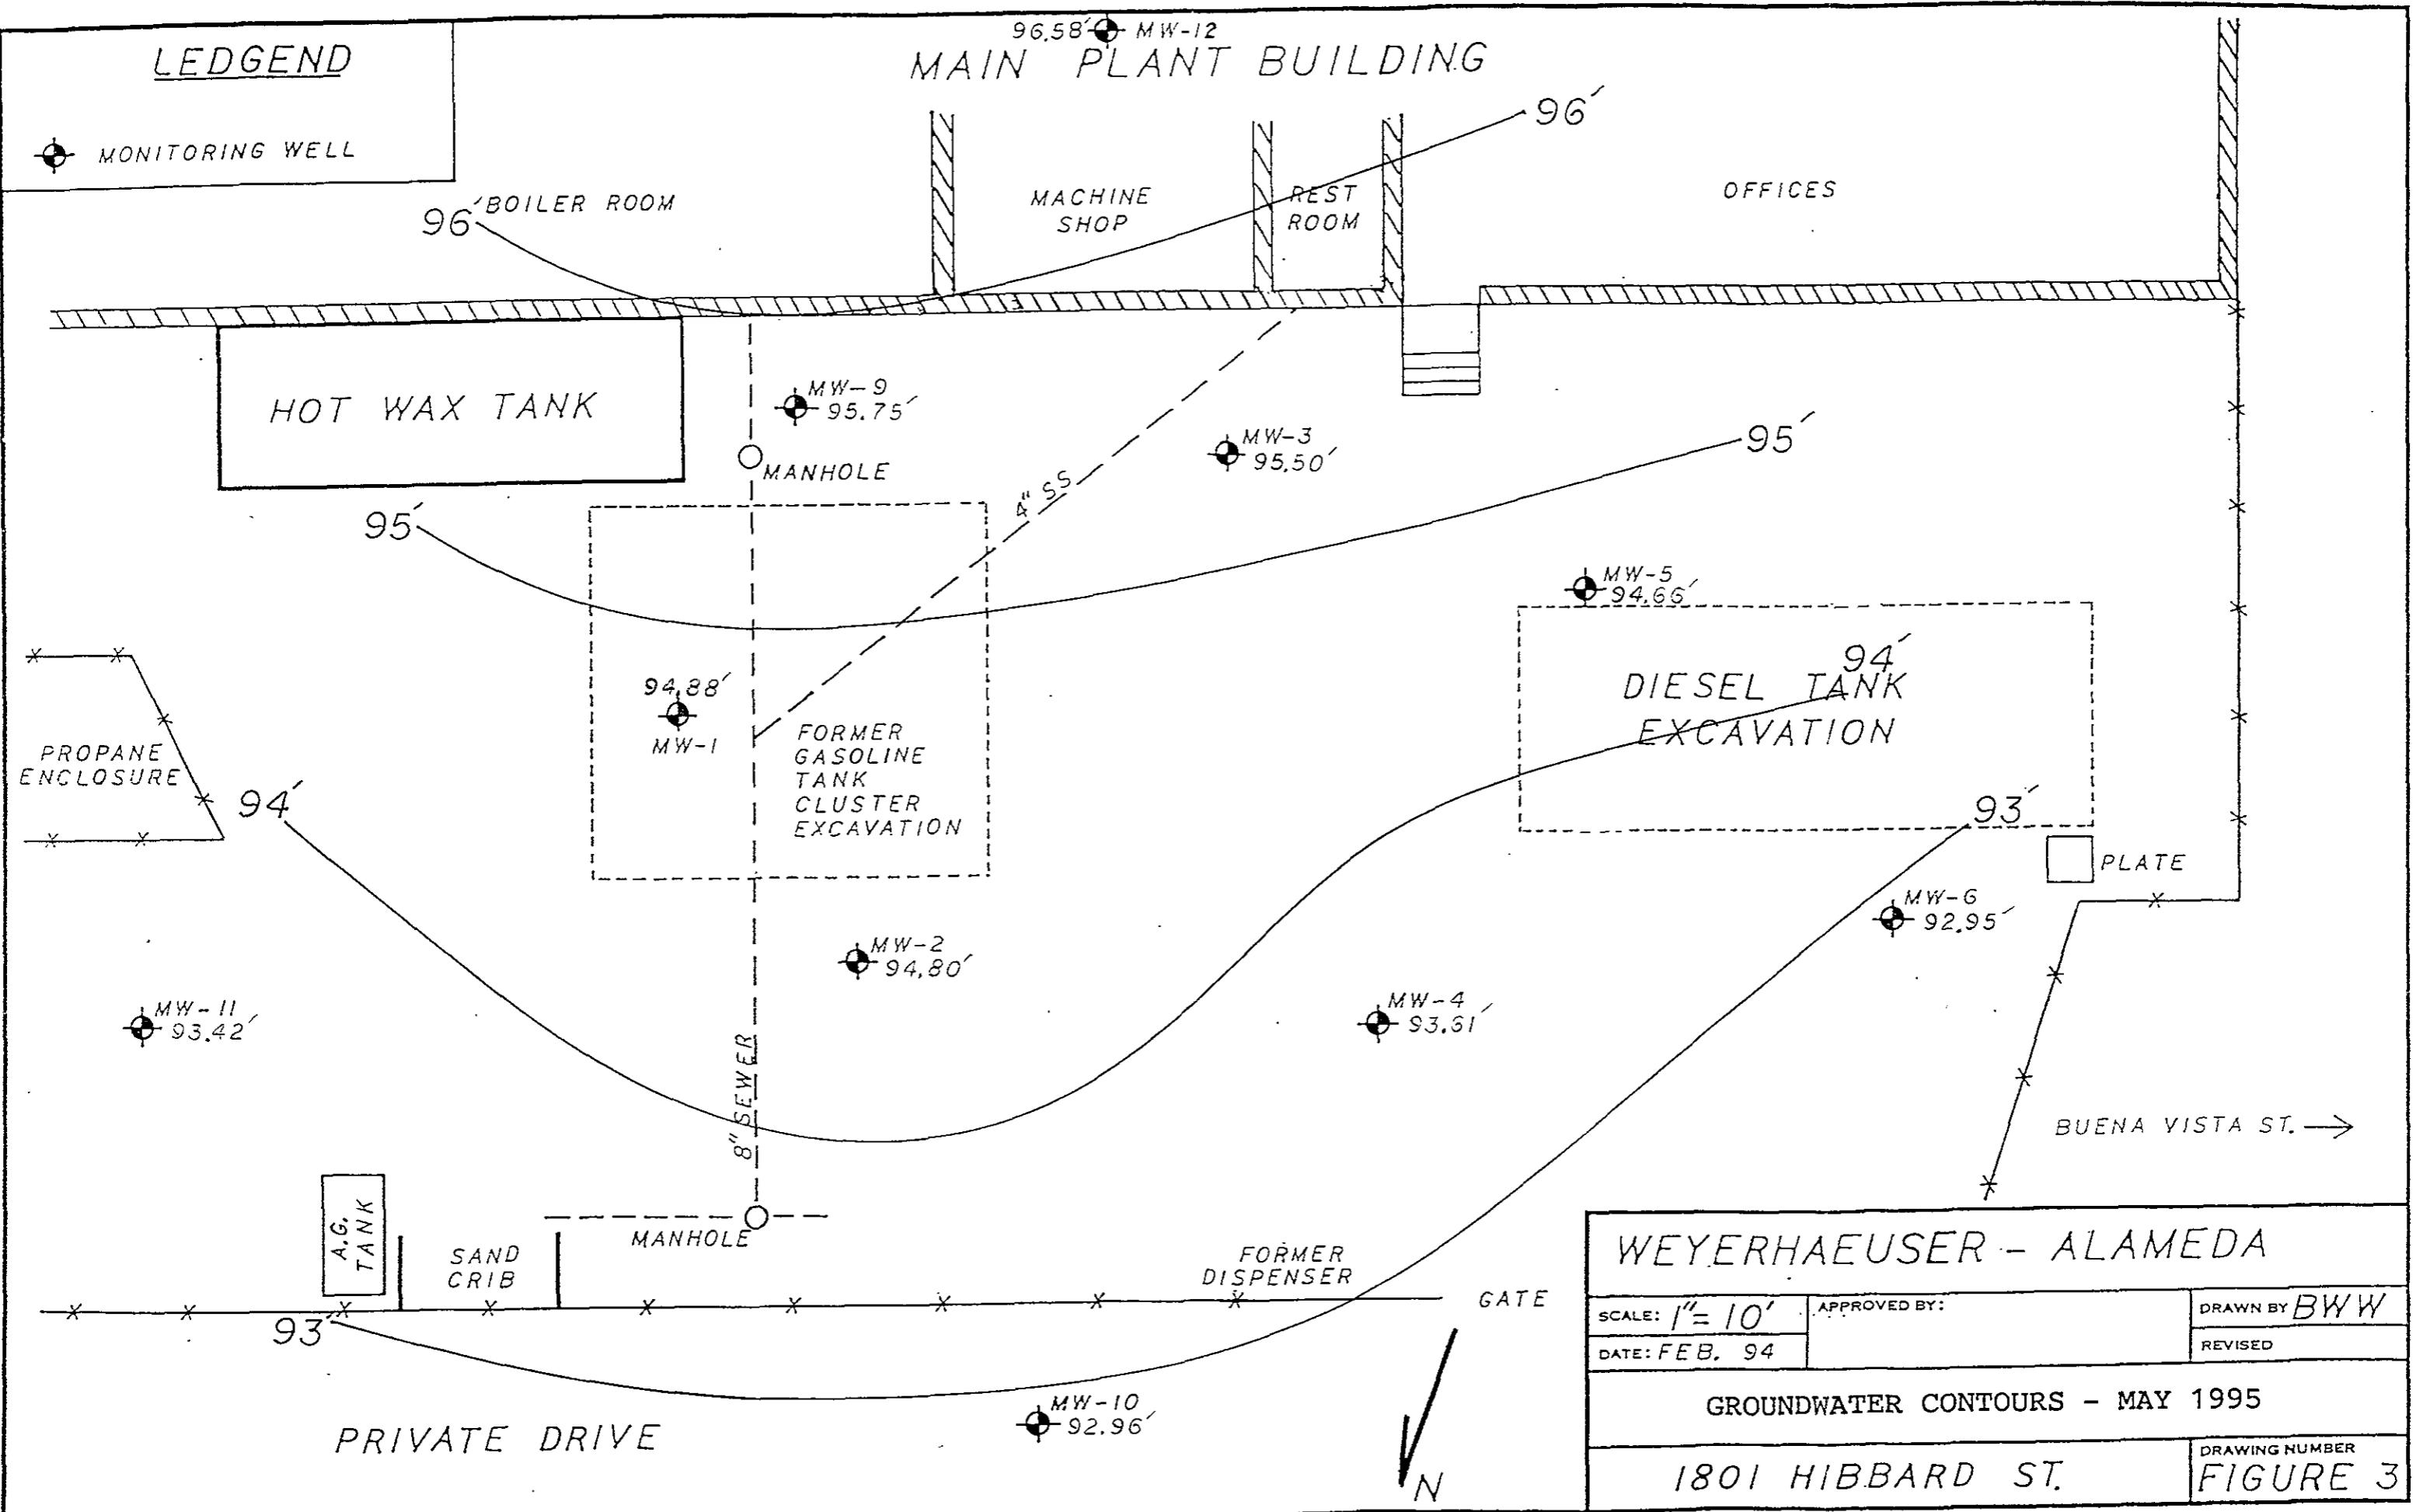

Groundwater elevations rose under most of the site this quarter as compared to last quarter. Groundwater elevations were found to decline at the locations of MW-1, MW-2, MW4 and MW-11, near the former gasoline tank cluster study area.

#### 5.0 SUMMARY

- All eleven WPC groundwater wells were monitored on May 17, 1995.
- No floating product was observed in any groundwater well this quarter.
- The contaminant profile in groundwater has not significantly changed from previous quarters.
- Groundwater levels have risen slightly under most of the site as compared to last quarter (March 7, 1995).

## GROUNDWATER SAMPLING - PURGE DATA FORM

Project: WEYERHAEUSER ALAMEDA

Location: PRIVATE DRIVE EAST of Plant

Monitoring Well ID: MW-10 Sampler: BWW/SD

Date: MAY 17, 1995 Time: 12:50 AM PM

Floating Product: Y (N) Petroleum Sheen: Y (N)

ODOR / APPEARANCE: SILTY

$$\frac{18'}{\text{WELL DEPTH}} \cdot \frac{6.25'}{\text{DTGW}} \times \frac{2"}{.17} \cdot \frac{4"}{66} = \frac{8}{\text{WELL VOLUME (GALS)}}$$

### PURGE MEASUREMENTS

TIME	PURGE VOLUME GALLONS	CUMULATIVE GALLONS	TEMP. °F	CONDUCT μmhos x 10	pH
12:50	0	0	58.1	7.82	7.46
:57	6	6	59.6	8.72	7.92
1:02	1	12	59.2	7.71	8.01

## REPORT OF LABORATORY ANALYSIS

June 05, 1995

Mr. Brian West  
West & Associates  
112 Pepperell Court  
Vacaville, CA 95688

RE: PACE Project Number: 701604  
Client Project ID: WPC ALAMEDA

Dear Mr. West:

Enclosed are the results of analyses for samples received on May 19, 1995. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

A handwritten signature in black ink that reads "Ronald M. Chew".

Ron Chew
