Subject: Summary Report of Soil and Groundwater Investigation Former Learner Investment Company Property 768 46th Avenue, Oakland, California SLIC Case RO0002478 and Geotracker Global ID SLT2O150156

Dear Mr. Wickham:

The enclosed Summary Report was prepared by LFR Inc. (LFR) on behalf of Neu Investment Corporation for Former Learner Investment Company Property 768 46th Avenue, Oakland, California SLIC Case RO0002478 and Geotracker Global ID SLT2O150156 ("the Site"). This report presents the findings of additional subsurface investigations conducted during April 2008 by LFR to further characterize the extent of contamination at the Site. The scope of work for the investigation conducted was described in a work plan that was submitted to Alameda County Environmental Health (ACEH) on November 8, 2007 and was approved by ACEH on December 3, 2007.

As required, this report will be submitted electronically via the Alameda County Environmental Cleanup Oversight Program FTP website, and via the Regional Water Quality Control Board's Geotracker electronic submittal system.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report are true and correct to the best of my knowledge. If you have any questions or comments concerning this report, please call me at (415) 229-8888 or Ron Goloubow of LFR at (510) 652-4500.

Sincerely,

Marcella Harrison
GVA Kidder Mathews, as agent for Neu Investment Corporation

1.0 INTRODUCTION

LFR Inc. (LFR) has prepared this report on behalf of the Neu Investment Corporation (“Neu Corporation”), the current owners of the former Learner Investment Company property. This report summarizes the results of the soil and groundwater investigation that was conducted at the Learner property located at 768 46th Avenue, Oakland, California (“the Site”; Figures 1 and 2; Alameda County Department of Environmental Health [ACEH] SLIC Case RO0002748; Geotracker Global ID SLT2O150156). The Site is informally divided into the northern portion and the “Flag Lot.” The Flag Lot is a portion of the former Learner site that is currently leased by Westside Building Materials. The configuration of the Flag Lot is illustrated on Figure 2.

LFR understands that the Site and several neighboring sites (Superior Plaster Castings, Westside Building Materials, and Pacific Gas and Electric Company [PG&E]) are currently undergoing soil and groundwater investigations with the oversight of ACEH. In a letter dated July 11, 2007 from ACEH to the Neu Corporation, ACEH requested further assessment of polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), and metals in soil and groundwater at the Site.

The scope of work for the investigation conducted at the Site and presented in this report was described in the “Plan for Additional Site Assessment, Learner Investment Company Property, 768 46th Avenue, Oakland, California (SLIC Case RO0002478; Geotracker Global ID SLT2O150156)” (“the Work Plan”), dated November 8, 2007. The Work Plan was approved by ACEH on December 3, 2007, with some requested revisions. The revisions to the scope of work included advancing additional soil borings, collecting additional samples, and conducting additional analyses.

At the time of the investigation in April 2008, access in the southeastern portion of the Site was limited due to the presence of large soil stockpiles and standing water (Figure 5). Thus, proposed soil borings LP-3, LP-12, and LP-14 could not be drilled and sampled.

1.1 Site History

As described in the Work Plan, an asphalt batch plant operated on a small portion of southwestern part of the Site prior to Learner acquiring the property. The main portion of the asphalt batch plant was located on the northwestern part of the Westside Building Materials property. Learner purchased the Site in the 1960s and operated a scrap metal bailing yard until October 1982 when operations ceased. The yard received scrap metal materials such as old appliances, industrial machinery, motors, empty drums, and other scrap metal light enough to be hydraulically compressed. The scrap was loaded into a hydraulic bailer via an electric crane and compressed into bails. Prior to 1971, automobiles were also bailed at the Site. After bailing, the scrap metal was resold to steel mills (Dames & Moore 1988a).

After the yard was closed in 1982, Learner ceased operations and no activity reportedly took place at the Site until January 1988. At that time, Learner intended to redevelop the Site into an office and warehouse complex. Learner began to disassemble and remove the bailer and associated equipment including a large hopper, electric crane, and a pump house that included an aboveground tank and piping containing hydraulic fluid for the bailer (Figure 3). A set of railroad tracks along the northeastern property boundary was also removed (Dames & Moore 1988a).

During the removal of the railroad tracks and the disassembly of the bailing equipment in 1988, Dames & Moore observed excavations and soil stockpiles at the Site. Two large piles of soil (reportedly 6 to 8 feet high) were located approximately 50 feet north of the former bailing area and were formed following removal of the railroad bed material. The piles consisted primarily of soil with some gravel, small wood pieces, and metal scrap. Several other large piles (reportedly 8 to 10 feet high) located south of the former bailer consisted of soil and metal scrap that accumulated from material from the former on-site operations. Another pile estimated to be approximately 12 feet high and 15 feet in diameter, comprised of metal cables with some piping and scrap metal, was observed in the area south of the former bailer (Dames & Moore 1988a).

In July 1988, Dames & Moore conducted investigation activities in three areas of concern: the former bailing area, the soil pile areas, and the narrow drive area (Figure 3). In the former bailing area, nine test pits were excavated with a backhoe to a depth of approximately 6 feet below ground surface (bgs). Some discontinuous dark staining was observed in the upper few inches of soil adjacent to the bailer and pump house concrete pads. Elevated concentrations of TPH (detected by U.S. Environmental Protection Agency [EPA] Methods 3550/418.1) were generally limited to the shallow soil samples collected at test pit location 11 at a depth of approximately 2.5 feet bgs, directly north and east of the former bailer (Figure 3). The highest reported TPH concentration in a soil sample collected in this area was 3,770 milligrams per kilogram (mg/kg) at a depth of approximately 2.5 feet bgs. Southeast of the crane concrete pad, TPH was detected at a concentration of 2,860 mg/kg in a soil sample collected at a depth of approximately 2.5 feet bgs. TPH concentrations in all soil samples collected at a depth of approximately 4.5 feet bgs were below the laboratory detection limit of 5 mg/kg, except for one sample in which TPH was detected at a concentration of 7.2 mg/kg. PCBs were not detected above the laboratory detection limit of 0.01 mg/kg in the soil samples collected from test pits 3 and 4 located near the bailer area (Figure 3; Dames and Moore 1988b).

Composite soil samples were collected from three sections of the narrow drive area. The highest TPH concentration was detected at 1,830 mg/kg in a sample composited from discrete samples collected at depths of approximately 1.5 and 2 feet bgs. TPH was detected in the other two composite samples at 247 mg/kg and 645 mg/kg. PCBs were present above the analytical detection limit in two of the three composite samples at 0.06 and 0.57 mg/kg (Figure 3; Dames and Moore 1988b).

Composite soil samples P1A-P1B and P2A-P2B were collected from two former soil pile areas and analyzed for TPH and PCBs. TPH was detected at 3,610 mg/kg and

3,920 mg/kg in the two composite samples (Figure 3). PCBs were detected in both samples at 25.2 mg/kg and 19.9 mg/kg. It is unknown if these soil piles still remain at the Site. In June 1988, a 700-gallon diesel fuel underground storage tank was removed from the Site (Figure 4). Two soil samples (A-1 and A-2) were collected from the native soil beneath each end of the tank at a depth of approximately 8 feet bgs. The samples were analyzed for TPH as gasoline and TPH as diesel (TPHd), benzene, toluene, ethylbenzene, and total xylenes (BTEX), and total lead. TPH and BTEX were not detected in one of the samples. In the other sample, TPH and xylenes were detected at 4.9 and 0.16 mg/kg, respectively (Figure 4). Total lead was detected at 3.0 mg/kg and 6.5 mg/kg (Kaprelian Engineering, Inc., 1988).

In June 1989, Kleinfelder, Inc., collected 11 surface samples at locations illustrated on Figure 4; four of the samples were located near the former bailing area, four were located near the soil pile, and three were located near the narrow access drive area. Reportedly, most of the soil samples also contained debris, which included metal scraps, glass, and wood. The soil samples were analyzed for TPH (by EPA Method 418.1), lead, chromium, cadmium, nickel, zinc, corrosivity, reactivity, ignitability, and aquatic toxicity. In addition, one soil sample was analyzed for the 17 California Code of Regulations (CCR) Title 22 metals, and three soil samples were analyzed by the Waste Extraction Test procedure (Kleinfelder 1990).

In a letter dated April 7, 1993, ACEH responded to the investigation work plan dated February 16, 1993 and prepared by Weiss Associates. The work plan specified the installation of eight soil borings, four to be placed around the former bailing area and four in the drive area. Additionally, three monitoring wells were to be installed based on grab groundwater sampling results that were previously collected at the Site. Based on observations made by LFR in April 2008, one groundwater monitoring well is present at the Site.

The work plan was approved with some modifications. ACEH requested the consideration of all previous soil and groundwater-quality data that exhibited levels which exceeded the allowable CCR, Title 22 total threshold limit concentration (TTLC) and/or the soluble threshold limit concentration (STLC). ACEH further noted that both the TTLC and the STLC levels were exceeded in soil samples collected from stockpile B-11 and B-12 for lead and zinc as reported in the August 21, 1991 Weiss Associates report. Also, TTLC values in soil samples B-3, B-10, B-11, and B-12 were exceeded for cadmium, chromium, and nickel. In samples B-8 and B-9, TTLC values were exceeded for chromium. Each soil sample contained concentrations of lead that exceeded 10 times the STLC (ACEH 1993).

Following regrading of the Flag Lot portion of the Site in 2002, LFR collected three soil samples in the Flag Lot (Flag-1, Flag-2, and Flag-3) at a depth of approximately 0.5 foot bgs and analyzed the samples for metals. These soil samples were collected to confirm that previously detected concentrations of metals had been reduced to acceptable levels. Analytical results for these samples did indicate that the concentration of metals were reduced to levels consistent with the range of naturally occurring metals concentrations in soil in the San Francisco Bay Area (Lawrence

Berkeley National Laboratory [LBNL] 2002). The sample locations and analytical results for these samples are shown on Figure 4 (LFR 2004).

1.2 Objectives

The objective of this investigation is to further characterize the extent of TPH, PCBs, and metals in both soil and groundwater at the Site. To achieve this objective, 15 soil borings were proposed to be drilled and sampled. Three of the soil borings could not be drilled due to access constraints at the Site. The total depth of each boring was between approximately 8 to 12 feet bgs. One of the soil borings (LP-1) was located on a portion the Learner property that has been referred to as the “Flag Lot” (Figure 5).

This report includes a presentation of the methods and results of the recent investigation, as well as conclusions and recommendations. LFR’s evaluation of the data collected at the Site includes comparing the concentrations of compounds detected in soil and groundwater samples at the Site to the following human health-based regulatory screening criteria: Environmental Screening Levels (ESLs) for commercial-industrial sites where the groundwater is not a potential source of drinking water.

These ESL criteria were established by the Regional Water Quality Control Board. ESLs were developed to address environmental protection. Under most circumstances, the presence of a chemical in soil or groundwater at concentrations below the corresponding ESL can be assumed to not pose a significant threat to human health. ESLs can be obtained from <http://www.waterboards.ca.gov/sanfranciscobay/esl.shtml>.

1.3 Geology and Hydrogeology

The Site is located just north of the San Leandro Bay inlet of San Francisco Bay, and is underlain by Bay Mud and fluvial deposits. According to Woodward-Clyde Consultants, the Bay Mud ranges in thickness from less than 1 foot to more than 120 feet and is characterized by its saturation with saltwater and its low permeability (Woodward-Clyde Consultants 1993).

The groundwater quality has been described as brackish and of no practical use. Based on the lithologic data collected from the soil borings drilled at the Site in April 2008, the upper 12 feet of soil beneath the Site consists of interbedded layers of gravel, sand, silt, and clay. Based on previous investigations on neighboring properties, depth to groundwater in the site vicinity is 7 to 8 feet bgs, and the groundwater flow direction reported by PG&E (located southwest of the Site) is to the southwest.

2.0 SCOPE OF INVESTIGATION

To further characterize the extent of TPH, PCBs, and metals in both soil and groundwater at the Site, LFR supervised the drilling of 12 soil borings (LP-1, LP-2, LP-4 through LP-11, LP-13, and LP-15; Figure 5). In accordance with the Work Plan

and the ACEH letter of December 3, 2007, soil samples were collected from each of the soil borings and grab groundwater samples were collected from a selected number of soil borings (LP-1, LP-2, LP-6, and LP-13).

There were two deviations from the scope of work described in the approved Work Plan. As discussed above, access to soil boring locations LP-3, LP-12, and LP-14 was inhibited by the presence of soil piles and standing water. In addition, soil boring LP-4 did not yield groundwater so a grab groundwater sample could not be collected at this location. The soil and groundwater samples were submitted to Curtis & Tompkins, Ltd. (C&T), a state-certified laboratory located in Berkeley, California, for analysis.

This section describes the pre-field and drilling activities conducted by LFR during this investigation, and presents the rationale for the selected sample locations and laboratory analyses.

2.1 Pre-Field Activities

2.1.1 Permitting

LFR acquired the necessary drilling permit from and paid permit fees to the Alameda County Public Works Agency to advance the soil borings at the Site for the collection of soil and grab groundwater samples. A copy of the approved drilling permit is included in Appendix A.

2.1.2 Subsurface Utility Clearance

Prior to beginning drilling work, LFR subcontracted SubDynamic Locating Services of San Jose, California, to perform subsurface utility locating at the Site to identify possible subsurface obstructions and utilities. All proposed soil boring locations were properly cleared in the presence of the field geologist overseeing the drilling activities.

2.1.3 Health and Safety Plan

A site-specific health and safety plan (HSP) was prepared to document potential hazards to worker health and safety at the Site during the field activities and to specify the appropriate means to mitigate or control hazards. The HSP addressed the potential for exposure to hazardous constituents and described general safety procedures. A health and safety meeting was conducted before fieldwork began, and applicable activities were completed according to the HSP.

2.2 Soil Borings, Soil Sampling, and Lithologic Logging

LFR subcontracted Gregg Drilling, Inc., of Martinez, California, a state-licensed drilling subcontractor, to advance the six soil borings using a direct-push Geoprobe™ drilling rig. Drilling and soil and grab groundwater sampling activities were completed

on April 4, 2008. During drilling, continuous soil cores were collected for lithologic evaluation and field screening. LFR collected depth-discrete soil samples for laboratory analyses from intervals where field screening and field observations indicated the possible presence of petroleum hydrocarbons or other compounds in the soil. Where no indication of contamination was observed in the soil cores, LFR collected depth-discrete soil samples at between 3 and 5 feet bgs. Soil samples were collected at the Site and retained using the Encore™ soil sample containers.

Field boring logs were prepared by an LFR field geologist for each soil boring location. Lithologic descriptions based on the Unified Soil Classification System (American Society for Testing and Materials D2488-00) and field screening observations were recorded on the field boring logs. Soil boring logs were reviewed by a California Professional Geologist, and were transcribed into report-quality graphic logs presented in Appendix B.

Soil samples were collected during drilling on a continuous basis at depths between approximately 1 and 5 feet bgs and retained for laboratory analyses. Soil cores and soil samples were reviewed for visible or olfactory indications of the presence of petroleum hydrocarbons, and also were field screened using a portable photoionization detector (PID) to assess the presence of hydrocarbons or other volatile organic compounds (VOCs), and results were recorded on the soil boring logs. Soil borings were logged by an LFR field geologist under the supervision of a California Professional Geologist. The soil samples were described using the Unified Soil Classification System. The lithologic descriptions were recorded on soil boring logs provided in Appendix B.

Soils encountered during drilling consisted predominantly of fine-grained sediments (clays and silts) with thin intervals of coarser grained sediments (gravels and sands). Soil cores were reviewed for visible or olfactory indications of the presence of petroleum hydrocarbons, and also were screened in the field using a portable PID. Field observations and PID readings are noted on lithologic logs, and intervals selected for collecting soil samples for laboratory analyses were selected in part based on the results of the field screening and observations.

Depth-discrete soil samples were selected for laboratory analyses based on the potential presence of contaminants, as apparent from field screening using a PID or from visual/olfactory evaluation of the soil cores. Soil samples were obtained by directly pushing the continuous-core barrel lined with acetate sleeves into the soil at each of the six soil borings. Soil samples retained for TPH and VOC analyses were collected in three Encore™ soil sample containers. Soil samples retained for metals and PCB analyses were retained in the acetate core barrel liner. The ends of the acetate liner were sealed with Teflon™-lined plastic caps, which then were sealed and properly labeled with the boring identification number and depth interval, the time and date of collection, the analysis requested, and the initials of the sampler. All samples were stored in ice-chilled coolers and submitted to the laboratory under strict chain-of-custody protocol.

2.2.1 Equipment Decontamination and Borehole Abandonment

Down-hole drilling and sampling equipment was appropriately cleaned with high-pressure hot water (steam cleaned) before use at each new drilling location within a portable containment unit. After soil and groundwater samples were collected, each borehole was abandoned by sealing it with a mixture of cement and bentonite (“grout”) from the bottom up to the ground surface using a tremie pipe if groundwater was present or poured directly into the borehole if groundwater was not present. Waste soil generated during drilling was placed in 5-gallon buckets and will be disposed of within the next 90 days.

2.3 Grab Groundwater Sampling

Grab groundwater samples were collected from soil borings LP-1, LP-2, LP-6, and LP-13. These soil borings were advanced to approximately 12 feet bgs to allow for the collection of the grab groundwater samples. Each boring was advanced approximately 4 feet into the first observed saturated sediments. After drilling was completed, a temporary polyvinyl chloride (PVC) well screen and casing was placed in the soil boring. Grab groundwater samples were collected using a clean, stainless steel bailer lowered into the PVC casing, and the groundwater sample was gently poured from the bailer into the appropriate, clean, laboratory-supplied water sample containers. Sample containers were properly labeled and stored in ice-chilled coolers for daily transport to the analytical laboratory under chain-of-custody protocol.

2.4 Laboratory Analyses

Laboratory analyses of soil and grab groundwater samples were conducted by C&T. Soil samples selected for laboratory analyses were submitted for analyses under a “standard” turnaround schedule. Samples not initially selected for analyses were submitted to the laboratory but were placed on hold.

2.4.1 Soil Sample Analyses

A total of 24 soil samples were submitted to C&T for the following analyses:

- TPHd and TPH as motor oil (TPHmo), using EPA test method 8015, modified; soil samples underwent a silica gel cleanup prior to analysis to remove naturally occurring fats or oils that can result in false positive results for TPH components
- VOCs using EPA test method 8260b
- California Assessment Manual (CAM) 17 metals using EPA test method 6010b
- PCBs using EPA test method 8082
- two soil samples were analyzed for polynuclear aromatic hydrocarbons using EPA test method 8270

The soil samples were collected between 1 and 5 feet bgs with the majority of the samples collected at 2 and 4 feet bgs.

2.4.2 Grab Groundwater Sample Analyses

A total of four grab groundwater samples were submitted to C&T for the following analyses:

- TPHd and TPHmo, using EPA test method 8015, modified; the groundwater samples underwent a silica gel cleanup prior to analysis to remove naturally occurring fats or oils that can result in false positive results for TPH components
- VOCs using EPA test method 8260
- CAM 17 metals using EPA test method 6010b; these samples were filtered and preserved at the C&T laboratory

The laboratory-certified analytical reports are included in Appendix C.

2.4.3 Data Validation Summary

LFR performed a level III data validation evaluation of the analytical data collected during the site investigation. The data validation evaluation was conducted in accordance with the EPA Data Validation Functional Guidelines for Evaluating Environmental Analyses, “U.S. EPA Contract Laboratory Program National Functional Guidelines for Organic Data Review,” dated October 1999, and “U.S. EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review,” dated October 2004 (EPA 2004).

The following is a summary of the evaluation of analytical data for soil and groundwater samples collected as part of the investigation that took place at the Site in April 2008.

The data were evaluated based on the following parameters:

- data completeness
- holding times
- blanks
- system monitoring compound spike recoveries (surrogates)
- matrix spike/matrix spike duplicate (MS/MSD) recoveries
- laboratory control spike/laboratory control spike duplicate (LCS/LCSD) recoveries

A review of the analytical results revealed a number of issues that caused the data to be qualified.

The percent recoveries of the surrogate decachlorobiphenyl were below the laboratory's quality assurance/quality control (QA/QC) range for the PCB analyses of soil samples. Aroclor results for samples LP-13-2FT, LP-13-4FT, LP-6-2FT, LP-6-4FT, LP-7-2FT, LP-7-4FT, LP-5-4FT, LP-4-2FT, LP-4-4FT, LP-11-2FT, LP-9-1FT, LP-9-4FT, LP-15-1FT, LP-15-5FT, LP-2-1FT, and LP-2-5FT were qualified.

The MS and MSD were both above the laboratory's QA/QC range for the analysis of barium in soil samples. Analytical results of barium in samples LP-10-2FT, LP-10-4FT, LP-13-2FT, LP-13-4FT, LP-6-2FT, LP-6-4FT, LP-7-2FT, LP-7-4FT, LP-8-2FT, LP-8-4FT, LP-5-2FT, LP-5-4FT, LP-4-2FT, LP-4-4FT, LP-11-2FT, LP-11-4FT, LP-9-1FT, LP-9-4FT, LP-15-1FT, LP-15-5FT, LP-2-1FT, and LP-2-5FT were qualified.

The remainder of the analytical results did not reveal additional issues that caused the data to be qualified. Based upon this evaluation of the project data, it appears that the data are valid and available for use in the site characterization.

3.0 LABORATORY ANALYTICAL RESULTS

Analytical results for soil samples collected by LFR in April 2008 are summarized in Tables 1 through 4 and the grab groundwater samples collected by LFR in April 2008 are summarized in Tables 5 through 7.

For the purposes of evaluating and discussing the analytical results, the analytical results were compared with commercial land use ESL values where groundwater is not a source of drinking water.

3.1 Total Petroleum Hydrocarbons and BTEX in Soil

Analytical results for TPHd, TPHmo, and BTEX in soil samples collected by LFR are summarized in Table 1 and on Figure 5.

TPHd was detected at concentrations ranging from 4.9 mg/kg to 920 mg/kg in soil samples collected between approximately 1 and 5 feet bgs in 15 of the 24 soil samples. The concentrations of TPHd detected in 13 of the 15 samples exceeded the ESL for TPHd at sites where groundwater is not a source of drinking water (150 mg/kg). In addition C&T reported that the chromatographic pattern for each sample that contained TPHd above analytical reporting limits did not resemble the laboratory standard for TPHd. The note provided by C&T indicates that the TPHd detected in these samples is likely associated with a longer-chained hydrocarbon that is consistent with oil (a carbon chain length of C24 to C36).

TPHmo was detected at concentrations ranging from 48 mg/kg to 2,600 mg/kg in 22 of the 24 soil samples collected between approximately 1 and 4 feet bgs in the 12 soil borings. The concentration of TPHmo detected in the soil sample collected from

approximately 2 feet bgs in soil boring LP-4 was the only concentration that exceeded the ESL for TPHmo where groundwater is not considered a current or potential source of drinking water (2,500 mg/kg). Six other soil samples contained concentrations of TPHmo at concentrations greater than 1,000 mg/kg.

BTEX compounds were not present above the laboratory reporting limits in any of the 24 soil samples collected at the Site in April 2008.

3.2 VOCs in Soil

Analytical results for VOC analyses (EPA method 8260b) of the 24 soil samples collected by LFR are summarized in Table 2. 1,2-Dichlorobenzene and sec-Butylbenzene were detected at 8.6 micrograms per kilogram ($\mu\text{g}/\text{kg}$) and 5.8 $\mu\text{g}/\text{kg}$ in one soil sample (LP15-5FT). 2-Butanone was detected at 8.3 $\mu\text{g}/\text{kg}$ in the soil sample collected at approximately 5 feet bgs from soil boring LP-5. Acetone, a common laboratory contaminant, was also detected in this sample and the sample collected at approximately 4 feet bgs from soil boring LP-1(Table 2). Methylene chloride, another common laboratory contaminant, was detected in the samples collected at approximately 2 and 4 feet bgs from soil boring LP-6 (Table 2). None of these chemicals detected were present above their respective ESLs at sites where groundwater is not a source of drinking water.

3.3 PCBs in Soil

Analytical results for the 24 soil samples collected by LFR and analyzed for PCBs (EPA method 8082) are summarized in Table 3 and on Figure 5. As shown in Table 3 and on Figure 5 the PCBs Aroclor 1242, Aroclor 1248, Aroclor 1254, and Aroclor 1260 were detected above their ESL of 300 $\mu\text{g}/\text{kg}$ in 12 of the 24 soil samples collected at the Site. These 12 samples were collected from eight of the 12 soil borings, and seven of the 12 soil samples contained PCBs at concentrations greater than 1,000 $\mu\text{g}/\text{kg}$.

Concentrations of PCBs above the ESL were detected in soil samples collected from approximately 2 feet bgs at the following soil boring locations: LP-5, LP-6, and LP-7. At these locations, the soil samples collected from approximately 4 feet bgs did not contain PCBs above the ESL, indicating that the PCB-affected soil is likely limited to the upper 3 feet of soil.

Concentrations of PCBs above the ESL were detected in soil samples collected at approximately 2 and 4 feet bgs at the following soil boring locations: LP-2, LP-8, LP-10, LP-11, and LP-15. At these locations, the soil samples collected at approximately 2, 4, and/or 5 feet bgs contained PCBs above the ESL, indicating that the vertical extent of PCB-affected soil extends to at least 4 feet bgs. The location of these soil borings are in the center-interior of the Site (Figures 5 and 6).

3.4 Metals in Soil

Analytical results for the 24 soil samples collected by LFR and analyzed for metals (EPA method 6010) are summarized in Table 4 and on Figure 6. As indicated in Table 4 and on Figure 6, the concentrations of metals detected in many of the soil samples collected at the Site in April 2008 are within the range of naturally occurring metals concentrations in soil as reported in the San Francisco Bay Area LBNL study (LBNL 2002). However, the six metals arsenic, cadmium, copper, lead, nickel, and zinc were detected at concentrations greater than their ESLs. All six metals were detected at concentrations greater than their ESLs in two samples, while five of the metals were detected at concentrations greater than their ESLs in two other samples (Table 4).

While concentrations of arsenic exceeded the ESL of 1.5 mg/kg, the concentrations of arsenic are within the range of naturally occurring arsenic in soil in the San Francisco Bay Area (19.1 mg/kg for arsenic [LBNL 2002]). One soil sample collected at approximately 4 feet bgs in soil boring LP-8 contained arsenic at 38 mg/kg. This sample also contained concentrations of cadmium, copper, lead, nickel, and zinc above their respective ESLs.

Three soil samples, collected between approximately 4 and 5 feet bgs from soil borings LP-8, LP-11, and LP-15, contained one or more metals (not including arsenic) above their ESL, indicating that the vertical extent of metals-affected soil at these locations extends to at least 4 or 5 feet bgs.

3.5 Total Petroleum Hydrocarbons and BTEX in Groundwater

TPHd was detected at concentrations ranging from 51 micrograms per liter ($\mu\text{g/l}$) to 2,500 $\mu\text{g/l}$ in grab groundwater samples collected at approximately 8 to 12 feet bgs in soil borings LP-1, LP-2, and LP-6 (Table 5). TPHmo was detected at concentrations ranging from 680 $\mu\text{g/l}$ (two samples) to 3,000 $\mu\text{g/l}$ in grab groundwater samples collected at approximately 8 to 12 feet bgs in soil borings LP-1, LP-2, and LP-13. The highest concentrations of TPHd and TPHmo were detected in grab groundwater samples collected from soil boring LP-2 that was located in the southeastern portion of the Site. These concentrations of TPHd and TPHmo at location LP-2 each exceeded the ESLs where groundwater is not considered a current or potential source of drinking water (Table 5).

BTEX compounds were not present above the laboratory reporting limits in the grab groundwater samples collected from the four soil borings.

3.6 VOCs in Groundwater

VOCs detected in grab groundwater samples collected by LFR in April 2008 are summarized in Table 6. Low concentrations of VOCs (significantly less than their respective ESLs) were detected in grab groundwater samples collected from LP-2 and LP-6.

3.7 Metals in Groundwater

Analytical results for metals analyses (EPA method 6010) in the four grab groundwater samples collected by LFR are summarized in Table 7. As indicated in Table 7, the following metals were present above laboratory reporting limits but below the ESLs in the grab groundwater samples: barium, chromium (one sample), molybdenum, nickel, and zinc (one sample; Table 7).

4.0 CONCLUSIONS

Groundwater is encountered at the Site at approximately 8 feet bgs. The groundwater flow direction has been reported to be to the southwest towards the San Francisco Bay. It is not known if the shallow groundwater is affected by tidal fluctuations of the San Francisco Bay.

Previous site usage included an asphalt batch plant that operated on the Site prior to Learner acquiring the property. Learner purchased the property in the 1960s and operated a scrap metal bailing yard until October 1982. Previous soil samples collected at the Site indicated that TPH-, PCB-, and metals-affected soil is present in soil samples collected across the Site. Lead was detected in four soil samples at concentrations exceeding the TTLC. The analytical results of the soil samples collected as part of the current investigation confirmed the presence of these compounds in shallow soil and indicated that the affected soil is spread across the Site.

The analytical results of the groundwater samples collected as part of the current investigation confirmed the presence of TPH-affected groundwater. Analytical results of the groundwater samples collected during this investigation did not contain concentrations of VOCs or metals that would warrant further assessment. Specifically, elevated concentrations of trichlorobenzene and dichlorobenzene compounds that were detected in the groundwater samples collected at the neighboring Westside Building Materials, PG&E, and Superior Plaster Castings sites were not detected in the groundwater samples collected as part of this investigation.

The future redevelopment plan for this property is not known. However, it appears that the Site has been adequately characterized, concerning soil and groundwater quality, to allow for the planning of the future redevelopment of the Site. Based on the presence and magnitude of certain chemicals in soil and groundwater at the Site, various remedial alternatives, with confirmation sampling, may be required for certain commercial-industrial uses. Likely, the redevelopment of the Site will include the removal of PCB- and metals-affected soil that would be disturbed during redevelopment activities.

APPENDIX A

Approved Drilling Permit

Alameda County Public Works Agency - Water Resources Well Permit

399 Elmhurst Street
Hayward, CA 94544-1395
Telephone: (510)670-6633 Fax:(510)782-1939

Application Approved on: 03/28/2008 By vickyh1

Permit Numbers: W2008-0149
Permits Valid from 04/02/2008 to 04/04/2008

Application Id: 1206123756877
Site Location: 768 46th Avenue
Project Start Date: 04/02/2008
Requested Inspection: 04/02/2008
Scheduled Inspection: 04/02/2008 at 2:00 PM (Contact your inspector, Vicky Hamlin at (510) 670-5443, to confirm.)

Applicant: LFR Inc - Ron Goloubow
1900 Powell #1200, Emeryville, CA 94116
Property Owner: Marcella Harrison GVA Kidder Mathews
505 Sansome Street #300, SF, CA 94111
Client: ** same as Property Owner **
Contact: Rob Moniz
Phone: 510-652-4500
Phone: 415-229-8965
Phone: 510-652-4500
Cell: 510-409-3831

Receipt Number: WR2008-0093	Total Due: \$200.00
Payer Name : LFR Inc.	Total Amount Paid: \$200.00
	Paid By: CHECK
	PAID IN FULL

Works Requesting Permits:

Borehole(s) for Investigation-Contamination Study - 15 Boreholes

Driller: Gregg Drilling - Lic #: 485165 - Method: DP

Work Total: \$200.00

Specifications

Permit Number	Issued Dt	Expire Dt	# Boreholes	Hole Diam	Max Depth
W2008-0149	03/28/2008	07/01/2008	15	2.00 in.	10.00 ft

Specific Work Permit Conditions

1. Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings. All cuttings remaining or unused shall be containerized and hauled off site. The containers shall be clearly labeled to the ownership of the container and labeled hazardous or non-hazardous.
2. Boreholes shall not be left open for a period of more than 24 hours. All boreholes left open more than 24 hours will need approval from Alameda County Public Works Agency, Water Resources Section. All boreholes shall be backfilled according to permit destruction requirements and all concrete material and asphalt material shall be to Caltrans Spec or County/City Codes. No borehole(s) shall be left in a manner to act as a conduit at any time.
3. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.
4. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County an Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

Alameda County Public Works Agency - Water Resources Well Permit

5. Applicant shall contact Vicky Hamlin for an inspection time at 510-670-5443 or email to vickyh@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

6. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.

7. Permit is valid only for the purpose specified herein. No changes in construction procedures, as described on this permit application. Boreholes shall not be converted to monitoring wells, without a permit application process.

LP-1-10FT	202390-003

This data package has been reviewed for technical correctness and completeness. Release of this data has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures. The results contained in this report meet all requirements of NELAC and pertain only to those samples which were submitted for analysis. This report may be reproduced only in its entirety.

Signature: Troy Babor
Project Manager

Date: 04/17/2008

Quality Assurance Director

Date: 04/18/2008

CASE NARRATIVE

Laboratory number: **202390**
Client: **LFR Levine Fricke**
Project: **001-09466-01**
Location: **Learner**
Request Date: **04/03/08**
Samples Received: **04/03/08**

This hardcopy data package contains sample and QC results for one soil sample and one water sample, requested for the above referenced project on 04/03/08. The samples were received cold and intact. All data were e-mailed to Ron Goloubow on 04/17/08.

TPH-Extractables by GC (EPA 8015B):

No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:

No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:

5035 samples not analyzed within 48 hours were frozen. No analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A):

No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 202390 Date Received 4-3-08 Number of coolers 1
 Client LFR Project Learner

Date Opened 4-3-08 By (print) F Nichols (sign) [Signature]
 Date Logged in 4-3-08 By (print) F Nichols (sign) [Signature]

1. Did cooler come with a shipping slip (airbill, etc)? YES NO
 Shipping info _____

2A. Were custody seals present? YES (circle) on cooler on samples NO
 How many 1 over lip Name Unreadable Date 4-3-08

2B. Were custody seals intact upon arrival? YES NO N/A

3. Were custody papers dry and intact when received? YES NO

4. Were custody papers filled out properly (ink, signed, etc)? YES NO

5. Is the project identifiable from custody papers? (If so fill out top of form) YES NO

6. Indicate the packing in cooler: (if other, describe) _____

Bubble Wrap

Foam blocks

Bags

None

Cloth material

Cardboard

Styrofoam

Paper towels

7. If required, was sufficient ice used? Samples should be < or = 6°C YES NO N/A

Type of ice used: WET BLUE NONE

Temp(°C) No temp blank, All Cold

SAMPLES RECEIVED ON ICE DIRECTLY FROM FIELD. COOLING PROCESS HAD BEGUN.

8. Were soil Encore sampling devices present? YES NO

If YES, what time were they transferred to freezer? 1100

9. Did all bottles arrive unbroken/unopened? YES NO

10. Are samples in the appropriate containers for indicated tests? YES NO

11. Are sample labels present, in good condition and complete? YES NO

12. Do the sample labels agree with custody papers? YES NO

13. Was sufficient amount of sample sent for tests requested? YES NO

14. Are the samples appropriately preserved? YES NO N/A

15. Are bubbles absent in VOA samples? YES NO N/A

16. Was the client contacted concerning this sample delivery? YES NO

If YES, Who was called? _____ By _____ Date: _____

CASE NARRATIVE

Laboratory number: **202462**
Client: **LFR Levine Fricke**
Project: **001-09466-01**
Location: **Learner**
Request Date: **04/07/08**
Samples Received: **04/07/08**

This hardcopy data package contains sample and QC results for eight soil samples, requested for the above referenced project on 04/07/08. The samples were received cold and intact. All data were e-mailed to Ron Goloubow on 04/18/08.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):

High surrogate recovery was observed for trifluorotoluene (FID) in the LCS for batch 136952. High surrogate recoveries were observed for bromofluorobenzene (FID) in DCB-P4-3.0 (lab # 202462-009) and the LCS for batch 136952. No other analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):

Many samples were diluted due to the dark and viscous nature of the sample extracts. No other analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):

Many samples were diluted due to the dark and viscous nature of the sample extracts. DCB-P3-4.0 (lab # 202462-003) and DCB-P4-3.0 (lab # 202462-009) were diluted due to high non-target analytes. No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):

Low recoveries were observed for barium and lead in the MS of LP-1-4.0 (lab # 202462-001); the BS/BSD were within limits, and the associated RPDs were within limits. High recoveries were observed for chromium and nickel in the MSD of LP-1-4.0 (lab # 202462-001); the BS/BSD were within limits. High RPD was observed for chromium, molybdenum, and nickel in the MS/MSD of LP-1-4.0 (lab # 202462-001); the RPD was acceptable in the BS/BSD. No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 202462 Date Received 4-7-08 Number of coolers 1
 Client LFN Project Learner

Date Opened 4-7-08 By (print) F Nichols (sign) Fatih L
 Date Logged in 4-7-08 By (print) F Nichols (sign) Fatih L

1. Did cooler come with a shipping slip (airbill, etc)? YES NO
 Shipping info _____

2A. Were custody seals present? YES (circle) on cooler on samples NO
 How many _____ Name _____ Date _____

2B. Were custody seals intact upon arrival? YES NO N/A

3. Were custody papers dry and intact when received? YES NO

4. Were custody papers filled out properly (ink, signed, etc)? YES NO

5. Is the project identifiable from custody papers? (If so fill out top of form) YES NO

6. Indicate the packing in cooler: (if other, describe) _____

Bubble Wrap Foam blocks Bags None
 Cloth material Cardboard Styrofoam Paper towels

7. If required, was sufficient ice used? Samples should be < or = 6°C YES NO N/A

Type of ice used: WET BLUE NONE Temp(°C) No temp blank, Cold

SAMPLES RECEIVED ON ICE DIRECTLY FROM FIELD. COOLING PROCESS HAD BEGUN.

8. Were soil Encore sampling devices present? YES NO

If YES, what time were they transferred to freezer? _____

9. Did all bottles arrive unbroken/unopened? YES NO

10. Are samples in the appropriate containers for indicated tests? YES NO

11. Are sample labels present, in good condition and complete? YES NO

12. Do the sample labels agree with custody papers? YES NO

13. Was sufficient amount of sample sent for tests requested? YES NO

14. Are the samples appropriately preserved? YES NO N/A

15. Are bubbles absent in VOA samples? YES NO N/A

16. Was the client contacted concerning this sample delivery? YES NO

If YES, Who was called? _____ By _____ Date: _____

CASE NARRATIVE

Laboratory number: **202453**
Client: **LFR Levine Fricke**
Project: **001-09466-01**
Location: **Learner**
Request Date: **04/05/08**
Samples Received: **04/04/08**

This hardcopy data package contains sample and QC results for twenty two soil samples and three water samples, requested for the above referenced project on 04/05/08. The samples were received cold and intact. No encores devices were received for samples LP-6-2FT (CT# 202453-006) and LP-6-4FT (CT# 202453-007) only a brass sleeve. Therefore, the 8260 analysis were ran from one end of the sleeve. All other soils were received as 4 containers (1 brass sleeve and 3 encore devices). There were also two discrepancies with the sample ID on the container and that on the COC. We used the time sampled and the COC sample id. to match them up. Please refer to the cooler receipt checklist. All data were e-mailed to Ron Goloubow on 04/18/08.

TPH-Extractables by GC (EPA 8015B) Water:

No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:

Many samples were diluted due to the dark and viscous nature of the sample extracts. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:

LP-13 (lab # 202453-005) and LP-2 (lab # 202453-025) had pH greater than 2. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:

5035 samples not analyzed within 48 hours were frozen. High recoveries were observed for trichloroethene in the MS/MSD for batch 136789; the parent sample was not a project sample, the BS/BSD were within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples. Low surrogate recoveries were observed for dibromofluoromethane and 1,2-dichloroethane-d4 in the MS/MSD for batch 136789; the parent sample was not a project sample. High surrogate recoveries were observed for bromofluorobenzene in many samples. Methylene chloride was detected above the RL in LP-6-2FT (lab # 202453-006) and LP-6-4FT (lab # 202453-007); this analyte is a common laboratory contaminant. No other analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):

All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. Low surrogate recoveries were observed for decachlorobiphenyl in many samples; the corresponding TCMX surrogate recoveries were within limits. No other analytical problems were encountered.

CASE NARRATIVE

Laboratory number: **202453**
Client: **LFR Levine Fricke**
Project: **001-09466-01**
Location: **Learner**
Request Date: **04/05/08**
Samples Received: **04/04/08**

Metals (EPA 6010B and EPA 7471A) Soil:

High recoveries were observed for barium and nickel in the MS/MSD of LP-10-2FT (lab # 202453-001); the BS/BSD were within limits, and the associated RPDs were within limits. High RPD was observed for copper; the RPD was acceptable in the BS/BSD. No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A) Filtrate:

No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 202453

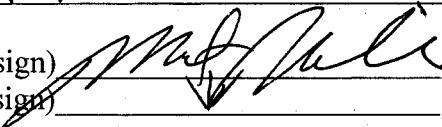

Date Received 4/4/08

Number of coolers 2

Client LPR

Project LEATHER

Date Opened 4/4/08

By (print) M. VILLANUEVA (sign) 

Date Logged in ✓

By (print) ✓

(sign)

1. Did cooler come with a shipping slip (airbill, etc)? YES NO

Shipping info _____

2A. Were custody seals present? YES (circle) on cooler on samples NO
How many _____ Name _____ Date _____

2B. Were custody seals intact upon arrival? YES NO N/A

3. Were custody papers dry and intact when received? YES NO YES

4. Were custody papers filled out properly (ink, signed, etc)? YES NO

5. Is the project identifiable from custody papers? (If so fill out top of form) YES NO

6. Indicate the packing in cooler: (if other, describe) _____

Bubble Wrap Foam blocks Bags None

Cloth material Cardboard Styrofoam Paper towels

7. If required, was sufficient ice used? Samples should be < or = 6°C YES NO N/A

Type of ice used: WET BLUE NONE Temp(°C) NOTICEME BLANK

SAMPLES RECEIVED ON ICE DIRECTLY FROM FIELD. COOLING PROCESS HAD BEGUN.

8. Were soil Encore sampling devices present? YES NO
If YES, what time were they transferred to freezer? 1930

9. Did all bottles arrive unbroken/unopened? YES NO

10. Are samples in the appropriate containers for indicated tests? YES NO

11. Are sample labels present, in good condition and complete? YES NO

12. Do the sample labels agree with custody papers? YES NO

13. Was sufficient amount of sample sent for tests requested? YES NO

14. Are the samples appropriately preserved? YES NO N/A

15. Are bubbles absent in VOA samples? YES NO N/A

16. Was the client contacted concerning this sample delivery? YES NO

If YES, Who was called? _____ By _____ Date: _____

COMMENTS
