Subject: Soil Sampling Results – Occupied Residential Lots  
Canterbury Residential Development  
Hayward, California

Dear Mr. Murphy:

On behalf of the City of Hayward, Geomatrix Consultants, Inc. (Geomatrix) has prepared this summary of the results of a soil sampling program performed on occupied lots in the Canterbury Residential Development in Hayward, California (Figure 1). The scope of work described herein was based on Geomatrix's September 1, 2000 work plan ("the work plan").<sup>1</sup>

Geomatrix's sampling effort was focussed to evaluate the quality of soil likely to be contacted by residents during typical landscaping activities. Soil samples collected from previous investigations conducted at adjacent unoccupied lots in the Canterbury development have indicated the presence of petroleum hydrocarbon-related compounds in the soil. SummerHill Homes offered to collect soil samples from occupied lots that had not been sampled during previous investigations in the area. Residents at 20 of 28 lots accepted the offer.

This report is divided into four sections. The first section describes the methods used to collect the soil samples. The second section describes the analytical methods used by the laboratories. The third section presents the results of the field and analytical programs. The fourth section compares the detected concentrations to U.S. Environmental Protection Agency (U.S. EPA) Preliminary Remediation Goals (PRGs) for residential land use.

## FIELD PROGRAM

Prior to performing the field investigation, Geomatrix reviewed the existing Health and Safety Plan to ensure its applicability to planned field activities. The Hayward Fire Department obtained access agreements from the homeowners of the lots that were sampled.

---

### Field Sampling Activities

On September 21, 22 and 28, 2000, Geomatrix advanced 19 shallow soil borings on 19 occupied lots. This included Lots 16 to 18, 20 to 23, 25 to 27, 30 to 31, 41 to 45, and 46 to 48. These borings were advanced to 0.5 feet below ground surface (bgs) using a hand auger. A hand-operated drive sampler lined with a 2-inch diameter by 6-inch brass sleeves was used to collect soil samples at the bottom of each hand-augered boring. After retrieval of the soil core, the borehole was screened for volatile organic compounds (VOCs) using an organic vapor monitor equipped with a photoionization detector (PID). Soil descriptions, OVM readings and sample identifications were recorded on a shallow soil-sampling log (Attachment B). The boreholes were backfilled with surrounding soil and the yard was restored to its original condition. Photographs were taken before and after sample collection.

Analysis of the initial soil sample results indicated elevated levels of total petroleum hydrocarbons quantified as motor oil (TPHmo) greater than 1000 milligrams per kilogram (mg/kg) and/or polycyclic aromatic hydrocarbons (PAHs) greater than U.S. EPA Region 9 Preliminary Remediation Goals (PRGs) on eight of the 19 lots sampled.

In accordance with the work plan Geomatrix advanced three additional shallow soil borings on each of the 8 lots (24 additional soil borings) on October 24 and 26, 2000 (Figure 2). The goal of the additional borings was to determine the lateral and vertical extent of the elevated concentrations of total petroleum hydrocarbon as motor oil (TPHmo) and/or PAHs. In general, a boring was advanced on each lot in the approximate location of the previous boring and a sample was collected at approximately 0.5 and 3 feet bgs. Two other borings were advanced about twenty feet away from the original boring to 0.5 feet bgs and a sample was collected from each boring.

Between sampling activities, Lot 27 was landscaped, which included a concrete pad over the original boring location. The follow-up boring was advanced at the closest possible location to the original sample. In addition, the owner of Lot 44, which had not been sampled, requested that samples be collected from his lot. Four soil samples were collected from three borings on Lot 44 in a configuration similar to the other lots. A shallow sample was analyzed, while the remaining two shallow samples and one deep sample were put on hold. The initial sample exceeded 1000 mg/kg of TPH so the additional samples were also analyzed. In addition, an aliquot from the opposite end of the sampling tube from the original sample also was analyzed.

After retrieval of the soil sample, each borehole was screened for VOCs using a PID. Soil descriptions, PID readings and sample identifications were recorded on a shallow soil-sampling log (Attachment B). The boreholes were backfilled with surrounding soil and the yard was restored to its original condition. Photographs were taken before and after the sample collection.

Mr. Hugh Murphy  
City of Hayward Fire Department  
May 23, 2001  
Page 3

The soil samples were packaged for laboratory analysis by covering the ends of the sample sleeves with Teflon™ sheets and plastic caps. The caps were secured with silicon tape. The soil samples were labeled, placed in resealable plastic bags, and stored in coolers with ice, pending delivery to an analytical laboratory under Geomatrix chain-of-custody.

All downhole equipment including hand auger bucket and rods, drive sampler, and sleeves, were washed with an Alconox solution, rinsed with deionized water, and then rinsed again with deionized water. Cleaning water was placed in a 55-gallon drum for characterization and disposal by SummerHill Homes.

### **Analytical Program**

As outlined in the work plan, soil samples were submitted to Friedman & Bruya, a California-certified analytical laboratory in Seattle, Washington for analysis of:

- total petroleum hydrocarbons quantified as motor oil (TPHmo), in accordance with U.S. EPA Method 8015 modified, after a silica gel cleanup;
- polycyclic aromatic hydrocarbons (PAHs), in accordance with U.S. EPA Method 8270C SIM (selected ion mode).

For quality assurance/quality control (QA/QC) purposes, Friedman and Bruya analyzed duplicate samples, method blanks, matrix spike/matrix spike duplicate samples, and laboratory control samples.

### **RESULTS OF FIELD PROGRAM**

This section presents the results of the field program. A summary of the soil types observed during sampling and a discussion of the analytical results follow.

#### **Soil Classification**

Soil observed during sampling is generally consistent with soil observed during sampling activities in other portions of the development.<sup>2</sup> Site stratigraphy consists of a fill unit underlain by lean clay. Soil boring logs for the 46 borings advanced are included as Attachment A.

The fill unit typically consists of firm gray to brown lean clay with minor amounts of fine to coarse sand and fine gravel. Shallow soil sampled consisted of clayey sand with gravel and appeared to be imported aggregate base material. The fill material is underlain at approximately 3 feet bgs by lean clay and lean clay with sand that typically grades in color from dark gray to light gray to brown.

### Analytical Laboratory Results

Analytical results for TPHmo and PAHs are summarized in Table 1. Laboratory analytical reports from Friedman and Bruya are presented in Attachments B. A review of the Quality Assurance/Quality Control data is presented in Attachment C.

TPHmo was detected in 49 of the 54 soil samples at concentrations ranging from 50 to 3500 mg/kg. Of the 49 samples containing TPHmo, 45 were collected at approximately 1-foot bgs (all 45 shallow samples) and four were collected at approximately 3 feet bgs (out of nine 3-foot samples).

Forty-one (41) of the 54 samples contained at least one PAH (Table 1); concentrations ranged from 5 to 2300 micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ). Thirty-nine (39) of these samples were collected at approximately 1 foot bgs and 2 were collected at approximately 3 feet bgs.

Of the eight lots that were resampled, benzo(a)pyrene (BaP) concentrations exceeded the PRG at two lots (27 and 30) with the maximum concentration of 420  $\mu\text{g}/\text{kg}$  at GMX-TRN-30A-1.0. TPHmo exceeded 1000 mg/kg in all eight lots (16, 17, 21, 30, 41, 44, 45, and 47) with the maximum concentration of 3500 mg/kg at GMX-TRN-47A-1.0. The additional samples from these lots resulted in both higher and lower concentrations of TPHmo and benzo(a)pyrene (BbP) although the approximately 3-foot sample was lower than the shallow samples in all cases except for TPHmo at GMX-TRN-27B-3.5. Average concentrations of TPHmo in shallow soil in the eight lots ranged from 360 to 1550 mg/kg (Table 2). These values are within the range of TPHmo concentrations (up to 1600 mg/kg) considered acceptable for occupancy of lots previously sampled for this project.<sup>3</sup>

### DISCUSSION OF RESULTS

In accordance with the work plan, concentrations of PAHs detected at the site were compared with residential Preliminary Remediation Goals (PRGs) established by U.S. EPA Region 9.<sup>4</sup> Total petroleum hydrocarbon measurements, such as TPHmo, represent mixtures of chemicals that, because of their potentially highly variable composition, have no associated health criteria. Therefore, the toxicity of these mixtures is best described by the aggregate toxicity of key individual chemicals in the mixture. As is the practice in California,<sup>5</sup> only petroleum hydrocarbon constituents detected in soil, i.e., PAHs, were considered for comparison to PRGs.

<sup>3</sup> Geomatrix, 2000, Final Soil Sampling Results – Unoccupied Residential Lots, Canterbury Residential Development, Hayward, California, April.

<sup>4</sup> U.S. EPA, 1999, Region 9 Preliminary Remediation Goals (PRGs), October 1.

May 23, 2001  
Page 5

PRGs combine current U.S. EPA toxicity values with standard exposure factors to estimate concentrations in environmental media (e.g., soil) that are protective of human health, including sensitive subgroups, over a lifetime. For some chemicals, variations in exposure or toxicity assessment required in California have been applied and a "Cal-modified" PRG has been published. The Cal-modified PRGs have been used in this assessment, where available. If chemicals are present at concentrations below the PRGs, then exposure to these chemicals should not result in adverse health effects. If multiple chemicals are present, then the potential for adverse health effects associated with cumulative exposure may need to be evaluated. The presence of chemicals at concentrations exceeding PRGs does not indicate that adverse health effects will occur, but "suggests that further evaluation of the potential risks that may be posed by site contaminants is appropriate."<sup>5</sup> The PRGs are listed at the bottom of the Tables 1 and 2 for detected chemicals.

With the exception of benzo(a)pyrene and benz(a)anthracene, concentrations of the remaining PAHs were at least 4 times lower than their respective PRGs. One sample (GMX-TRN-30A-1.0) contained benzo(a)anthracene above the PRG. Seven samples contained benzo(a)pyrene above the PRG (GMX-TRN-21D-2.0, GMX-TRN-27A-1.0, GMX-TRN-27C-1.0, GMX-TRN-27D-1.0, GMX-TRN-30A-1.0, GMX-TRN-30B-1.0, and GMX-TRN-30D-1.0).

To further evaluate potential health risk, the data was provided to the Department of Toxic Substances Control (DTSC). Based on information provided by representatives of DTSC, their evaluation was based on the calculation of benzo(a)pyrene equivalents for the seven carcinogenic PAHs in shallow soil at each lot. Because these PAHs are considered to have cumulative effects, the Office of Environmental Health Hazard Assessment (OEHHA) of California Environmental Protection Agency (Cal-EPA) has developed equivalency factors for the carcinogenic PAHs related to the most toxic component, benzo(a)pyrene<sup>6</sup>. As presented in Table 2, DTSC multiplied the concentration of each PAH detected in soil by the appropriate equivalency factor, which resulted in a concentration in terms of BaP equivalents. If a PAH was not detected, DTSC multiplied one-half the detection limit times the corresponding equivalency factor. By summing the BaP equivalents for each PAH, DTSC developed a total BaP equivalent for each sample. DTSC used an average of the total BaP equivalents used as the representative concentration for each lot. DTSC compared these representative concentrations to the total BaP equivalent PRG for all the carcinogenic PAHs. As shown on Table 2, the representative concentration for each lot was well below the total BaP equivalent PRG of 432 µg/kg. As described in DTSC's letter dated April 16, 2001, "Exposure to contaminant levels found below PRGs will not cause adverse health effects. Based on the benzo(a)pyrene equivalents calculated for the subjects lots, no cleanup for this contaminant is required by DTSC."

---

<sup>6</sup> An equivalency factor for dibenzo(a,h)anthracene has not been published by OEHHA. To be conservative, a factor of 1 was used based on the PRGs for dibenzo(a,h)anthracene and benzo(a)pyrene.

## CONCLUSIONS

Based on data presented in this report and comparisons of detected soil concentrations to levels considered acceptable by U.S. EPA for residential site use and evaluation provided by DTSC, no further action is recommended.

## Notes:

d = The sample was diluted due to high levels of interfering compounds. Detection limits are raised due to dilution and surrogate recoveries may not be meaningful.

\* Replicate analysis of sample using soil from the other end of the sample container.

1. Analyzed in accordance with U.S. EPA Methods 8015 modified (TPHmo) and 8270 SIMS (polycyclic aromatic hydrocarbon), respectively.

2. TPHmo - Total Petroleum Hydrocarbons as Motor Oil

3. Detected values highlighted in bold.

4. NA - Not analyzed.

5. PRGs - Residential Preliminary Remediation Goals (U.S. EPA, 1999).

6. Analysis of sample GMX-TRN-44B-1.5 were taken from the opposite end of the sampling tube than that used for the previous analysis of the sample.

7. Samples were analyzed outside of normal holding time. All other quality control requirements were within acceptable limits.

8. Not available; PRGs have not been developed for mixtures. TPHmo evaluated based on the individual constituents detected.

9. A surrogate PRG was used because a PRG was not available for this compound. The surrogate selected based on physico-chemical properties was:

Acenaphthene for benzo(g,h,i)perylene;

Anthracene for phenanthrene.

Fluorene for acenaphthylene

TABLE 2

**AVERAGE TPH<sub>mo</sub> AND BENZO(A)PYRENE EQUIVALENT CONCENTRATIONS IN SHALLOW SOIL<sup>1</sup>**  
 Canterbury Residential Development  
 Hayward, California

Polycyclic aromatic hydrocarbon concentrations are reported in micrograms per kilogram ( $\mu\text{g}/\text{kg}$ )

Notes:

1. The concentrations of TPH<sub>mo</sub> are the measured concentration. The concentrations of PAHs are the measured concentration multiplied by the corresponding equivalency factors. If a PAH was not detected, one-half the detection limit was multiplied times the corresponding equivalency factor

2. TPH<sub>mo</sub> - Total Petroleum Hydrocarbons as Motor Oil

3. PRGs - Residential Preliminary Remediation Goals (U.S. EPA, 1999)

4. Cal-EPA, 1999, Technical Support Document Describing Cancer Potency Factors Office of Environmental Health Hazard Assessment

Notes:

<sup>1</sup> Borehole identification includes tract identification (TRN = Tract 7069; TRS = Tract 7124), lot number (e.g. 4), and boring identification (e.g. A, B).

<sup>2</sup> For shallow samples, borings were advanced from 0.0 to 0.5 feet below ground surface (bgs) with a hand auger. Drive samples were collected for chemical analysis from

0.5 to 1.0 feet bgs.

For deep samples, borings advanced to 3.0 feet bgs with a hand auger. Drive samples were collected from 3.0 to 3.5 feet bgs or 2.5 to 3.0 feet bgs.

<sup>3</sup> OVM = organic vapor meter, Thermo Environmental Instruments 580B PID calibrated with a 100 ppm isobutylene standard. Borehole screened with OVM after retrieval of drive sample.

<sup>4</sup> Sample identification uses the borehole identification number and adds the sample depth in feet at the end.

Dear Ms. Holbrow:

Included are the results from the testing of material submitted on October 27, 2000 from your 6262 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

CASE NARRATIVE

This case narrative encompasses samples received on October 27, 2000 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 6262 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>Geomatrix Consultants, Inc.</u>
010157-01	GMX-TRN-41C-1.0
010157-02	GMX-TRN-41B-1.0
010157-03	GMX-TRN-41D-1.0
010157-04	GMX-TRN-41B-3.5
010157-05	GMX-TRN-21C-1.0
010157-06	GMX-TRN-21B-1.0
010157-07	GMX-TRN-21D-1.0
010157-08	GMX-TRN-21B-3.5
010157-09	GMX-TRN-27B-1.0
010157-10	GMX-TRN-27C-1.0
010157-11	GMX-TRN-27D-1.0
010157-12	GMX-TRN-27B-3.5
010157-13	GMX-TRN-44B-1.5
010157-14	GMX-TRN-44D-1.0
010157-15	GMX-TRN-44B-3.5
010157-16	GMX-TRN-44C-1.0

All quality control requirements were within acceptable limits.

Dear Ms. Holbrow:

Included are the results from the testing of material submitted on October 26, 2000 from your 6262 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

CASE NARRATIVE

This case narrative encompasses samples received on October 26, 2000 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 6262 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>Geomatrix Consultants, Inc.</u>
010145-01	GMX-TRN-16B-1.0
010145-02	GMX-TRN-16C-1.0
010145-03	GMX-TRN-16B-3.5
010145-04	GMX-TRN-16D-1.0
010145-05	GMX-TRN-17C-1.0
010145-06	GMX-TRN-17B-1.0
010145-07	GMX-TRN-17B-3.5
010145-08	GMX-TRN-17D-1.0
010145-09	GMX-TRN-30B-1.0
010145-10	GMX-TRN-30C-1.0
010145-11	GMX-TRN-30D-1.0
010145-12	GMX-TRN-30B-3.0
010145-13	GMX-TRN-45C-1.0
010145-14	GMX-TRN-45D-1.0
010145-15	GMX-TRN-45B-1.0
010145-16	GMX-TRN-45B-3.5
010145-17	GMX-TRN-47B-1.0
010145-18	GMX-TRN-47C-1.0
010145-19	GMX-TRN-47B-3.5
010145-20	GMX-TRN-47D-1.0

All quality control requirements were within acceptable limits.

FRIEDMAN & BRUYA, INC.

Oakland, CA 94612

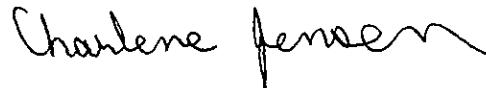

Dear Ms. Holbrow:

Included are the results from the testing of material submitted on October 2, 2000 from your 6262 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Charlene Jensen  
Chemist

CASE NARRATIVE

This case narrative encompasses samples received on October 2, 2000 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 6262 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>Geomatrix Consultants, Inc.</u>
010001-01	GMX-TRN-21A-1.0
010001-02	GMX-TRN-42A-1.0
010001-03	GMX-TRN-45A-1.0

All quality control requirements were within acceptable limits.

FRIEDMAN & BRUYA, INC.

ENVIRONMENTAL CHEMISTS

Date of Report: 10/13/00  
Date Received: 10/02/00  
Project: 6262

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

Dear Ms. Holbrow:

Included are the results from the testing of material submitted on September 25, 2000 from your 6262 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Dear Ms. Holbrow:

Included are the results from the additional testing of material submitted on October 27, 2000 from your 6262 project.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

ENVIRONMENTAL CHEMISTS

CASE NARRATIVE

This case narrative encompasses additional testing of samples received on October 27, 2000 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 6262 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>Geomatrix Consultants, Inc.</u>
010157-13	GMX-TRN-44B-1.5
010157-14	GMX-TRN-44D-1.0
010157-15	GMX-TRN-44B-3.5
010157-16	GMX-TRN-44C-1.0

As requested the portions used for analysis of sample GMX-TRN-44B-1.5 were taken from the opposite end of the sampling tube than that used for the previous analysis of the sample.

As discussed, samples were analyzed outside of normal holding time. All other quality control requirements were within acceptable limits.

FRIEDMAN & BRUYA, INC.

## Appendix C

### Results of Quality Assurance/Quality Control

## ATTACHMENT C

### RESULTS OF QUALITY ASSURANCE/QUALITY CONTROL

Canterbury Residential Development

Hayward, California

The parameters used to evaluate data quality are as follows:

- Accuracy: The agreement of a measurement with an accepted reference or true value. Accuracy was assessed using the laboratory method blanks, laboratory control samples, and matrix spike samples. Laboratory method blanks test for false positive results. For laboratory control samples, the laboratory adds a known quantity of a chemical to deionized water, which is then analyzed. For matrix spike samples, a known quantity of a chemical is added to a site-specific sample designated on the chain-of-custody. In addition, the laboratory adds surrogates (chemicals with similar characteristics that are unlikely to be detected in environmental media) to each sample to test the accuracy of the measurements for these surrogate compounds. The accuracy goal for each analyte is specified by the laboratory on the laboratory data sheets (Attachment D).
- Precision: A measurement of the degree of agreement of replicate data, which is quantitatively assessed, based on the relative percent difference or standard deviation. Precision was assessed using matrix spike/matrix spike duplicate samples, laboratory control/duplicate samples, and site-specific duplicate samples selected by the laboratory. The precision goal for the relative percent difference for these samples was set at 20%.
- Completeness: The amount of valid data obtained from a prescribed measurement system throughout the project, as compared with that expected and required to meet the project goals.

Documentation of calculations for accuracy (percent recovery) and precision (relative percent difference) are presented in the laboratory data sheets for the appropriate quality assurance/quality control (QA/QC) sample (Attachment D).

#### *Accuracy*

Five method blanks were run for total petroleum hydrocarbons in the motor oil range (TPH<sub>Mo</sub>), and five method blanks were run for polycyclic aromatic hydrocarbons (PAHs). For method blank samples all analyte concentrations were below method reporting limits, indicating that the laboratory results represented the contents of the sample.

Surrogates were run in every sample analyzed. Surrogate recoveries were within analyte-specific control limits with the following exception:

- In five PAH samples (GMX-TRN-45C-1.0, GMX-TRN-45D-1.0, GMX-TRN-44D-1.0, GMX-TRN-44B-3.5, and GMX-TRN-44C-1.0) one of two surrogate recoveries exceeded control limits established for the analytes. This indicates results reported may be higher than actual concentrations. These samples were also diluted because of high levels of interfering compounds, and as a result, surrogate recoveries may not be meaningful.

Based on the volume of data collected for the site, these surrogate recovery issues are not considered to significantly affect the conclusions of the assessment, as they would only bias sampling results higher.

Matrix spike samples were also analyzed to evaluate the accuracy of the analytical results. All matrix spike/matrix spike duplicate (MS/MSD) samples for polycyclic aromatic hydrocarbons (PAHs) were within control limits. Of the four MS/MSD samples for TPHmo, one was spiked at a level that was less than five times that present in the sample, the result was not meaningful. The accuracy of the laboratory control sample results were within the analyte-specific control limits for each method, supporting the conclusion that matrix interference, and not laboratory procedures or instrumentation, resulted in the differences for PAHs.

#### ***Precision***

To evaluate precision, matrix spike/matrix spike duplicate samples, laboratory control samples, and laboratory duplicate samples were analyzed using each analysis method as discussed previously. Up to five laboratory duplicates, MS/MSD samples, and laboratory control samples were run for each analysis. The relative percent differences for these samples were within analyte-specific control limits with the following exceptions:

- RPDs for one total petroleum hydrocarbon as motor oil (TPHmo) were outside acceptance limits for one MS/MSD sample. The results were not considered meaningful as the spike level was less than five times that present in the sample, as discussed in accuracy section.
- The RPD results for one laboratory duplicate for PAHs were slightly above the acceptance criteria (20) for the two compounds detected (32 for fluorene and 24 for phenanthrene). These results may not reflect the variability of the analysis at low concentrations because the analytes were detected at less than five times the reporting limit.

The majority of the analyses used to evaluate precision were within their respective control limits. As such, these results are not considered to significantly affect the conclusions from this assessment.

### ***Completeness***

Data generated during the project were evaluated for completeness, that is, the amount of data meeting project QA/QC goals. Data generated for this project were considered complete for the purpose of the evaluation conducted.

April 16, 2001

Mr. Hugh J. Murphy  
City of Hayward Fire Department  
777 B Street  
Hayward, California 94541-5007

Dear Mr. Murphy:

The Department of Toxic Substances Control (DTSC) has reviewed the laboratory report submitted for soil sampling activities discussed during our meeting on December 19, 2000. The data reviewed were gathered from twenty (20) occupied lots at the Canterbury Residential Development in Hayward, California.

Soil sampling analytical results showed benzo(a)pyrene in seventeen (17) out of the twenty (20) lots sampled. The other three (3) lots showed non-detectable levels of benzo(a)pyrene. Current DTSC procedures require that benzo(a)pyrene equivalents be calculated if polynuclear aromatic hydrocarbons (PAHs) are present. This procedure was completed for the samples. Analytical results from each individual lot were evaluated using this procedure. For lots where multiple samples were collected, the arithmetic mean was calculated rather than the 95% upper confidence level (UCL) on that mean (US EPA Publication 9825.7-081, May 1992) due to the small number of samples from the individual residential lots. The US EPA Region IX's Preliminary Remedial Goal (PRG) for benzo(a)pyrene in residential soil is 0.062 ppm. We have used 0.062 ppm as the screening value for the sampled lots. The mean benzo(a)pyrene equivalents for the soil samples collected from the seventeen lots were all below PRGs.

DTSC has also reviewed additional data packages for the analysis of Total Petroleum Hydrocarbons (TPH) as motor oil and PAHs. The data packages included laboratory reports, quality control (QC) summaries and raw data for the samples collected. No contamination was found in method blanks.

As discussed in earlier letters from DTSC, PRGs are health based screening values. Exposure to contaminant levels found below PRGs will not cause adverse health effects. Based on the benzo(a)pyrene equivalents calculated for the subject lots, no cleanup for this contaminant is required by DTSC.

*The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our Web-site at [www.dtsc.ca.gov](http://www.dtsc.ca.gov).*

Mr. Murphy
