RE: Additional Subsurface Investigation Report
1685 24th Street
Oakland, California
ACC Project Number 6470-017.01

Dear Mr. Skepner:

Please find the enclosed two copies of the Additional Subsurface Investigation Report (Report) 1685 24th Street Oakland, California. Based on observations and analytical results of representative soil and grab groundwater samples, elevated concentrations of petroleum hydrocarbons as gasoline and a relatively minor impact from diesel were identified in soil and groundwater.

This Report addresses the technical comments in letter prepared by Mr. Barney Chan of the Alameda County Health Care Services Agency (ACHCSA), the lead regulatory agency, on September 17, 2003.

If you have any questions regarding the report, please contact me at (510) 638-8400, ext. 109.

Sincerely,

A handwritten signature in black ink that reads "David R. DeMent". The signature is cursive and fluid, with "David" on the first line and "R. DeMent" on the second line.

David R. DeMent, RG, REA II
Environmental Division Manager

ADDITIONAL SUBSURFACE INVESTIGATION REPORT

**1685 24th Street
Oakland, California**

1.0 INTRODUCTION

ACC Environmental Consultants Inc., (ACC), at the request of Skepner Development Corporation, has prepared this Report. The Report describes work performed at 1685 24th Street located in Oakland, California (Site).

The general goals of this additional subsurface investigation were to: 1) advance 12 exploratory soil borings to further characterize soil and groundwater in the vicinity of the former underground storage tanks (USTs); 2) further investigate the potential for vertical and horizontal migration of petroleum hydrocarbons in the subsurface; 3) obtain additional data regarding human health and ecological risk associated with residual petroleum hydrocarbons in the subsurface; and 4) prepare a report of findings for submission to the Alameda County Health Care Services Agency (ACHCSA) as the lead regulatory agency.

2.0 BACKGROUND

The subject property is bound by 24th Street to the north, Willow Street to the west, and the Pacific Pipe Company (PPC) pipe storage yards to the east and south (Figure 1). Circa 1966 to 1990, the subject property was utilized as a taxicab maintenance facility. From 1990 to the present, automotive repair operations have been conducted at the site by Lee's Auto Shop. In April 1987, seven underground storage tanks (USTs) were reportedly removed from the Site. According to records obtained at the Oakland Fire Department Office of Emergency Services, three 1,000 gallon gasoline USTs, two 8,000-gallon USTs, and two 7,500-gallon USTs were permitted for the Site. UST removal records indicate that two 7,500-gallon gasoline USTs, two 10,000-gallon gasoline USTs, and one 550-gallon waste oil tank were removed. While exact removed UST locations are unknown, they have been approximated on Figure 2. A copy of the information obtained during file review at the Oakland Fire Department is attached.

ACC conducted an initial subsurface investigation at the Site in August 2002. Subsurface soil and groundwater characterization was requested by another party for due diligence purposes due to historical site use and documented USTs at the Site. In order to confirm suspect soil and groundwater impacts from the former USTs, ACC located and advanced seven exploratory soil borings to collect representative soil and grab groundwater samples. Soil boring TB-1 and TB-2 were advanced on August 2, 2002 and "step-out" soil borings B25 through B29 were advanced on August 12, 2002. Field indications and sample analytical results indicated gasoline impacts were evident in soil and groundwater samples.

TPHg was reported in the grab groundwater sample from soil boring TB-1 at 5,000 micrograms per liter ($\mu\text{g}/\text{L}$) with relatively minor associated BTEX. TEPH was reported in sample TB-1-W at 2,000 $\mu\text{g}/\text{L}$. TPHg was reported in soil in soil borings B25, B28, and B29 at concentrations ranging from 36 to 190 milligrams per kilogram (mg/kg). Traces of free-phase floating product (free product) were observed on groundwater in soil boring B25, as evidenced by grab groundwater sample analytical results in B25-W. The reported concentrations of TPHg and

BTEX were significant but localized. Groundwater was generally encountered at approximately 7.5 feet bgs.

3.0 FIELD PROCEDURES

A drilling permit was obtained from the Alameda County Public Works Agency (ACPWA) prior to fieldwork. The proposed soil boring locations are illustrated on Figure 2. All soil borings will be clearly marked and outlined in white paint. Underground Service Alert will be notified at least 2 business days prior to performing drilling activities.

Soil sampling took place on June 18, 2004. Soil borings TB-3 through TB-10 and SS-1 were advanced using a truck mounted, hydraulically driven Geoprobe® sampling tool equipped with 2.0-inch inside diameter, clear acetate liners (four feet long) to depths of up to 12 feet bgs. All soil borings were continuously cored and selected soil samples were collected at representative depths to provide optimum information concerning subsurface soil conditions.

Soil borings TB-3 through TB-5, TB-10, and SS-1 were advanced to additionally characterize soil and groundwater across the Site. Soil borings TB-6 through TB-9 were advanced in the vicinity of the four remaining USTs located within the Pacific Pipe storage yard. Select soil samples were collected for analysis and ACC obtained one grab groundwater sample per soil boring to further characterize first-encountered groundwater, generally observed at approximately 7.5 feet bgs.

A California Registered Geologist performed soil borings and sampling, and the subsurface materials in the soil borings were identified, classified and logged. The subsurface soil samples were obtained by coring continuously with a hydraulically or pneumatically driven Geoprobe® sampling tools and retrieving the soil encased in the clear, acetate liners. Upon removal from the sampler, each recovered soil sample was visually inspected and logged. Soil samples were logged and classified during drilling operations according to the Unified Soil Classification System (USCS). Soil boring lithologic logs and a USCS guide are included as Appendix 1. Select soil samples were screened with a calibrated ppbRAE photoionization detector (PID). The sampling probe and rods were pre-cleaned prior to use and between sample drives by washing them with a trisodium phosphate and potable water solution, a potable water rinse, and distilled water rinse.

The sample intervals selected for analysis were capped with Teflon tape and tight fitting plastic caps, labeled and stored in a pre-chilled, insulated container to be transported following chain of custody protocol to STL San Francisco, Inc. (STL-SF), a state-certified analytical laboratory. Samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and total xylenes (BTEX), total extractable petroleum hydrocarbons (TEPH) as diesel and motor oil by EPA Method 8015M, halogenated volatile organic compounds (HVOCs) by EPA Method 8021B/8260B, and total lead by EPA Method 6010B.

Grab groundwater samples were collected from the first encountered groundwater zone in select soil borings with the use of dedicated, disposable polyethylene bailers. The water samples were immediately transferred to laboratory-supplied containers, labeled, and placed in a pre-chilled,

insulated container pending transport to STL San Francisco. Grab groundwater samples were analyzed for TPHg, BTEX, MTBE, and HVOCs by the EPA methods listed above.

Following drilling and sample collection, each soil boring location was abandoned with neat cement, allowed to settle, and refilled to just below the surface. The surface of each soil boring location was filled with concrete to grade.

4.0 FINDINGS

4.1 Subsurface Conditions

The surface of the Site in the area of the investigation is covered with three to four inches of concrete or asphalt pavement underlain by approximately three to six inches of baserock. Subsurface soil conditions varied at the Site and determining fill soil versus native soils was difficult. Soils consisted of silty sand (SM) from the surface to approximately 8 feet bgs adjacent to the taxi building in soil borings TB-3 through TB-5, TB-10, and SS-1. Soils in the pipe storage yard (soil borings TB-6 through TB-9) consisted of silty sand (SM) to a depth of approximately five to six feet bgs. The sands were medium to fine grained, moderately sorted, brown and olive brown, loose to medium dense, damp, and exhibited moderate estimated permeability. The first encountered saturated zone was observed at approximately eight to nine feet bgs. The silty sands were underlain by "Bay Mud" clays to 20 feet bgs, the depth of investigation. The olive green clays tended to be moderately to highly plastic, uniform, medium stiff, damp, and are generally considered impermeable (1E-06 cm per second).

Fill materials such as brick, debris, and organic matter were noted in soil borings TB-8, TB-9, and TB-10. As observed in numerous Bay Margin locations, the Site may have been a former "dump", or poor quality fill may have been placed below the sand materials during reclamation of the area.

All soil borings were continuously cored to better characterize soils present at the site. Some elevated PID readings, characteristic odors, or soil discoloration were noted during sampling activities. Additional details are included in the soil boring lithologic logs (Appendix 1) and the geologic cross section (Figure 3).

4.2 Analytical Results

The concentration of total lead ranged from 4.2 to 44 mg/kg in three soil samples collected in fill between 2.0 to 8.0 feet bgs. Total lead analytical results in soil are summarized in Table 1. Select soil samples from the soil borings were collected and submitted to STL San Francisco for analysis. TPHg was reported in eight of the eleven soil samples at concentrations ranging from 2.5 to 1,700 mg/kg. Seven of the eight soil samples with reportable TPHg concentrations were collected at depths of 7.5 to 9.0 feet bgs which is the depth of the estimated groundwater capillary fringe. TPHg and BTEX analytical results in soil are summarized in Table 2.

Grab groundwater samples were collected in each soil boring and submitted to STL San Francisco for analysis. TPHg was reported at concentrations ranging from 69 to 20,000 µg/L. BTEX concentrations were reported above their respective reporting limits in the eight

groundwater samples. TEPH as diesel was reported in the four grab groundwater samples at concentrations ranging from 680 to 7,700 µg/L. TPHg, BTEX, and MTBE analytical results are summarized in Table 2 and TEPH analytical results are summarized in Table 3.

HVOCS were not reported above their respective reporting limits in the grab groundwater and soil samples collected. A copy of the analytical results and chain of custody record is included as Appendix 2.

5.0 DISCUSSION

For purposes of due diligence for a prospective buyer, ACC previously prepared a Phase I Environmental Site Assessment (ESA) for this property. The Phase I ESA identified the former USTs as the primary environmental concern. In order to confirm suspect soil and groundwater impacts from the former USTs, ACC located and advanced seven exploratory soil borings in August 2002 to collect representative soil and grab groundwater samples in proximity to the estimated location of the former USTs. Field indications of gasoline impact and elevated PID readings were evident in soil in soil borings TB-1 but were not noted in soil boring TB-2. TPHg was reported in the grab groundwater sample from soil boring TB-1 at 5,000 µg/L with relatively minor associated BTEX. TEPH was reported in sample TB-1-W at 2,000 µg/L. Groundwater was generally encountered at approximately 7.5 feet bgs. With the exception of soil boring B25, soil and grab groundwater samples collected in the other "step-out" soil borings were relatively minor and indicative of degraded residual petroleum hydrocarbons from releases from the former USTs. Traces of free product were identified in groundwater at soil boring location B25.

Due to the initial subsurface findings, ACC conducted additional subsurface investigation in June 2004. Unlike during the August 2002 investigation, much of the area of investigation, primarily inside the Lee's Auto Yard extending from soil boring TB-3 to TB-10, was now accessible. Characteristic asphalt repairs indicative of a UST removal were observed at soil boring locations TB-4, SS-1, and TB-10. Originally, a former UST was suspected at soil boring TB-3 but direct observation and sample analytical results do not support this.

TPHg, BTEX, and TEPH as diesel are the primary constituents of concern identified in soil and groundwater. Subsurface impacts are not entirely characterized but appear to be localized to the general vicinity of the former USTs and horizontal and vertical migration potential is estimated to be minimal. Field indications of impact and sample analytical results indicate that a release from the former USTs occurred. With the possible exception of grab groundwater sample TB10-W, sample analytical results and laboratory notes generally indicate the reported petroleum hydrocarbons are degraded and that significant natural attenuation has likely occurred since April 1987.

Due to the request of ACHCSA, representative grab groundwater samples were further analyzed for HVOCS by EPA Method 8260B. HVOCS were not detected above the laboratory reporting limit in grab groundwater samples collected in TB-5, TB-6, TB-7, TB-9, TB-10, and SS-1. While reporting limits has to be increased significantly in TB-10 due to interference effects of hydrocarbons in the sample, the lack of detectable HVOCS in TB-6, TB-7, and TB-9 (located in the estimated downgradient direction), demonstrates that HVOCS impacts in groundwater are not evident.

6.0 CONCLUSIONS

Based on review of available documents pertaining to the subject property, sample analytical results, and field observations, ACC has concluded the following:

- Soil and groundwater in the vicinity of the former USTs has been impacted by petroleum hydrocarbons related to a suspect release(s) from the former USTs;
- Potential vertical migration of residual petroleum hydrocarbons is limited due to fine-grained Bay Mud clays present from approximately 12 to at least 20 feet bgs;
- HVOCS were not reported in groundwater in all five grab groundwater samples analyzed;
- Fine grained soils indicate that TPHg, BTEX, and TPHd impacts are likely localized to the immediate area of each former UST;
- Total lead concentrations reported in three discrete soil sample analyses appear representative of naturally occurring background concentrations; and
- Fill materials such as brick, debris, and significant amounts of organic matter were noted above the native Bay Mud clays and indicate the area was filled with poor quality fill materials and/or used as a “dump”; and
- Additional site investigation will likely be required if unrestricted site use or regulatory closure is pursued relating to the former USTs.

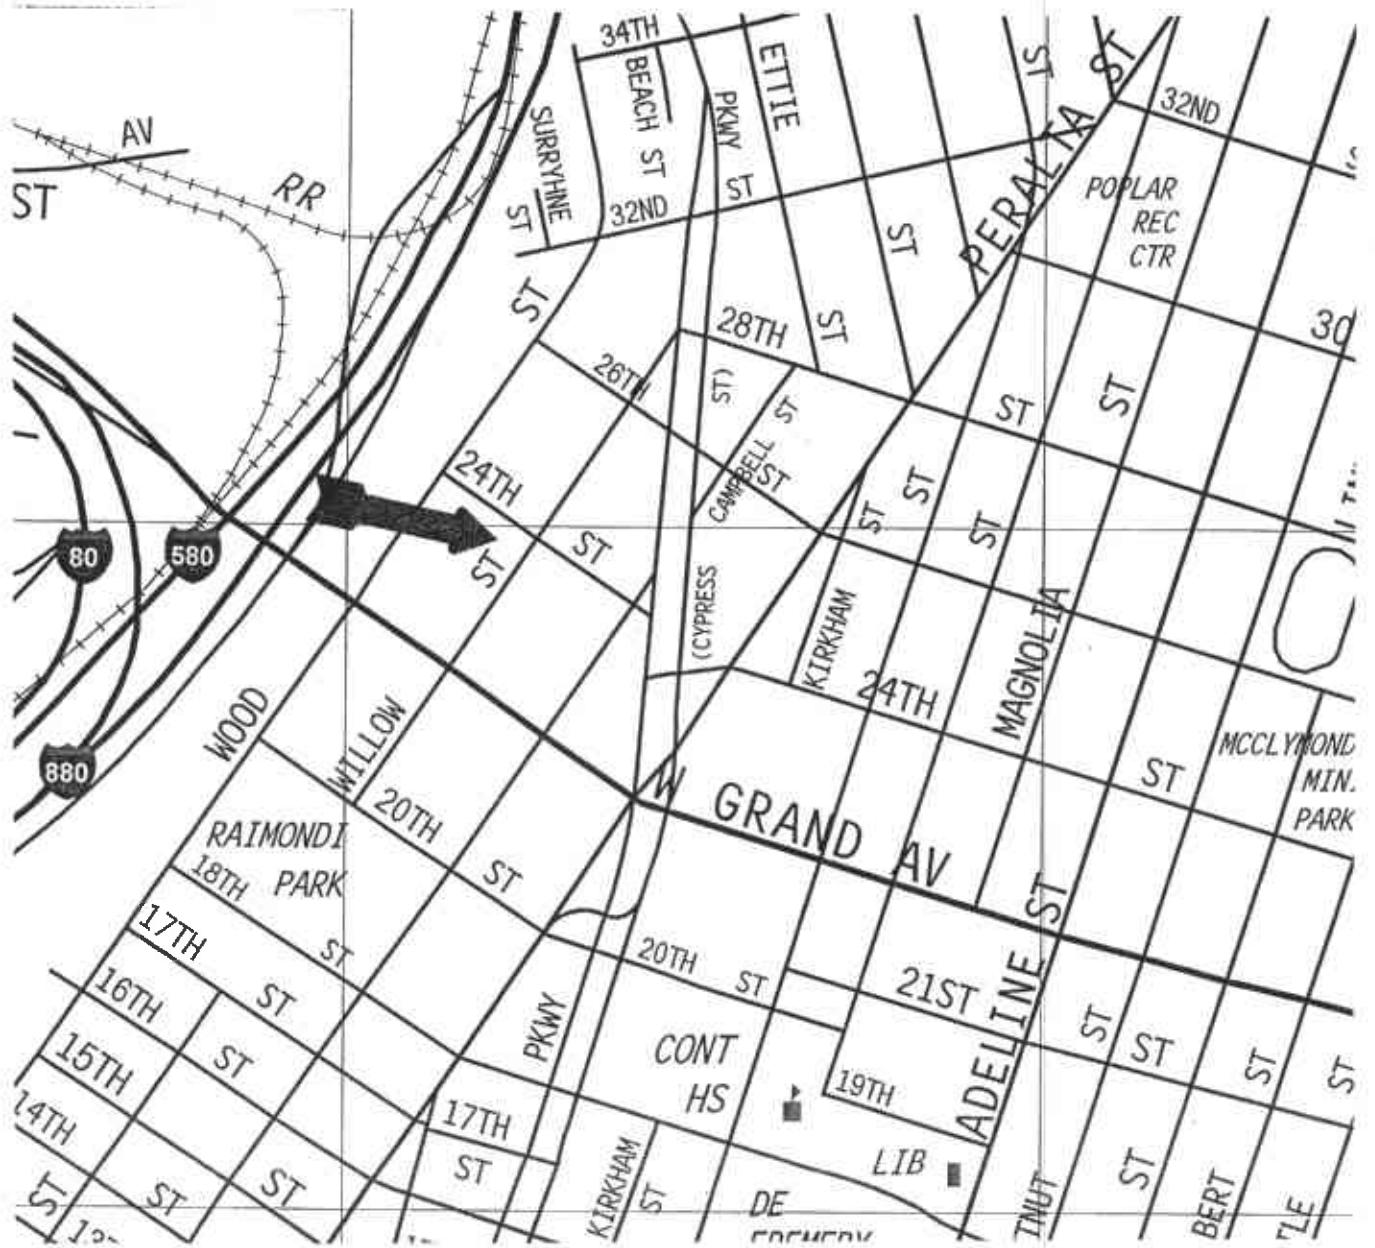

7.0 LIMITATIONS

The service performed by ACC has been conducted in a manner consistent with the levels of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions in the area. No other warranty, expressed or implied, is made.

The conclusions presented in this report are professional opinions based on the indicated data described in this report and applicable regulations and guidelines currently in place. They are intended only for the purpose, site, and project indicated. Opinions and recommendations presented herein apply to site conditions existing at the time of our study.

ACC has included analytical results from a state-certified laboratory, which performs analyses according to procedures suggested by the U.S. Environmental Protection Agency and the State of California. ACC is not responsible for laboratory errors in procedure or result reporting.

Dear Mr. DeMent,

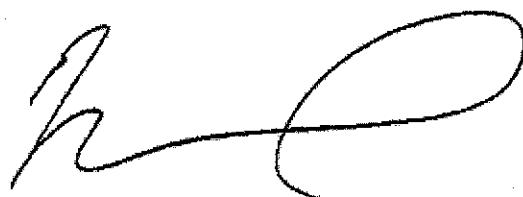

Attached is our report for your samples received on 06/21/2004 15:00
This report has been reviewed and approved for release. Reproduction of this report
is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after
08/05/2004 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,
please call me at (925) 484-1919.

You can also contact me via email. My email address is: vvancil@stl-inc.com

Sincerely,

Vincent Vancil

Legend and Notes**Analysis Flag**

o

Reporting limits were raised due to high level of analyte present in the sample.

Result Flag

sh

Surrogate recovery was higher than QC limit due to matrix interference.

si

Surrogate recoveries and internal standard were outside QC limits
due to matrix interference. Results biased high.

Legend and Notes**Analysis Flag**

lrn

Reporting limits raised due to high level of non-target analyte materials.

Result Flag

sh

Surrogate recovery was higher than QC limit due to matrix interference.
