**BASELINE ASSESSMENT REPORT**  
**Site Number 11128**  
**4707 First Street**  
**Livermore, California**

**CA & HI BOX:**  
**009404**

## **1. Site Features and History**

The site is an operating service station located on the south corner of First Street and South Front Road in Livermore, California. Site features include a station building containing two auto service bays with hoists, a canopy area with a concrete drive slab, and four pump islands. Existing USTs at the station include one 12,000-gallon, two 10,000-gallon, and one 1,000-gallon double wall fiberglass tanks installed in October 1987 (SWRCB, 1989). The four USTs store unleaded, plus unleaded, and super unleaded gasolines, and waste oil, respectively (SWRCB, 1992). An aboveground 225-gallon steel propane tank is also present at the station. The station manager indicated that the propane tank has been on site for 20 years, but that the tank has been replaced "now and then."

EMCON personnel visited the site on July 8, 1994. Two UST complex observation wells were noted during EMCON's site visit, but could not be accessed. The concrete drive slab and asphalt pavement were observed to be badly cracked, and an old abandoned refrigerator was noticed on site. During the site visit, the station manager also indicated that the station building roof leaks and that the service bays were formerly used for auto repair.

BP acquired the service station from Mobil in May 1989 (BP, 1989). Former USTs at the station included one 10,000-gallon, one 8,000-gallon, one 6,000-gallon, and one 280-gallon steel tank installed in 1972 and removed in 1987 (Mobil, 1986; Alameda County Department of Environmental Health, 1987).

Surrounding properties consist of gasoline service stations and various commercial businesses. A former Chevron service station is located east of the site across South Front Road. The Chevron station had a confirmed release of approximately 4,000 gallons of gasoline in 1985. Chevron was responsible for the cleanup at the intersection of South Front Road and First Street (Chevron, 1992; Alameda County, 1992; ACHCS, 1992). A UNOCAL service station is located north of the site across First Street, and a mall and restaurant are located northwest of the site across First

Street. A drainage culvert is located west of the site, and a new road was under construction south of the site in July 1994.

A site plan (Figure A-1) and tabulated data from EMCON's supplemental assessment work (Table A-1) are included with this report as Attachment A. Site photographs are included as Attachment B. Copies of figures and tabulated data from previous site investigations are included as Attachment C. Copies of laboratory reports from EMCON's supplemental site assessment work are included as Attachment D.

## **2. Previous Investigations and Remediation Activities**

Paradiso removed the four steel USTs from the station in October 1987 (Alameda County Department of Environmental Health, 1987). KEI supervised the tank removal and collected soil samples from the excavation for Mobil (KEI, 1987a). KEI (1987a) reported that the four tanks were in good condition. KEI collected six soil samples (A1, A2, B1, B2, C1, and C2) from the native soil beneath the fuel tanks, and one soil sample (W.O.-1) from beneath the waste oil tank (Figure C-1). Soil encountered during excavation consisted primarily of clayey sand. KEI (1987a) reported that a "slight odor" was detected in sample A1.

Soil sample A1, collected from a depth of 15 feet bgs, contained 260 ppm total hydrocarbons (THC; method unknown), benzene (1.2 ppm), toluene (2.4 ppm), and xylenes (19 ppm; Table C-1). Soil samples A2, B1, C1, and C2 contained between 1.4 to 2.3 ppm THC. Soil sample W.O.-1 contained 4 ppm methylene chloride and 0.17 ppm toluene (Table C-1).

KEI collected composite soil samples from the stockpiled soil excavated during the tank removal (KEI, 1987b). THC (3.6 ppm) and xylenes (0.6 ppm) were detected in one composite soil sample (Table C-2).

Nineteen wells were installed on behalf of Chevron at the Chevron service station site, BP service station site, and in the intersection in late 1985 or early 1986 (Figure C-2; Chevron, 1993a). According to Chevron (1993a), no soil samples were collected or analyzed during well installation. Chevron (1993a) indicated that the USTs at the Chevron station were replaced in January 1985.

In 1990, Chevron apparently connected a groundwater remediation air stripping unit to an extraction well installed on BP's property. The system did not appear to have been installed with BP's permission (BP, 1994). The system apparently only operated from March 26 to December 6, 1990 (ACHCS, 1992). According to ACHCS (1992), the data Chevron submitted to their office suggested that relatively clean downgradient water was

extracted along with the contaminated groundwater since the only extraction well was located on BP property downgradient from the Chevron site. ACHCS (1992) indicated that extracting groundwater from the BP well could "exasperate" the extent of the problem by "pulling" contaminants away from the Chevron site and toward the BP site. ACHCS (1992) required Chevron "at a minimum" [to] "engineer and install a system capable of meeting [the] goal" of controlling the further migration of its plume from the site. ACHCS (1992) stated that passive monitoring of contaminant levels was not appropriate.

Chevron monitored and sampled groundwater at the intersection from 1986 to approximately 1992 (Chevron, 1992). In 1991, Chevron shifted from quarterly to semiannual monitoring for some wells. Alameda County (1992) indicated that semiannual monitoring was not acceptable, and Chevron resumed quarterly sampling in 1992 (Chevron, 1992).

Chevron removed the inoperative groundwater extraction system and air stripping unit from well RW-1 on the BP property in July 1993 (Chevron, 1993b). Despite previous agency requests for further groundwater remediation (ACHCS, 1992), no evidence of resumed efforts to remediate groundwater at the intersection was found in BP or agency files made available to EMCON.

Alton conducted quarterly sampling of the 19 groundwater monitoring wells for Chevron in April, September, and October 1991, and in April 1992 (Alton, 1991a, 1991b, 1992). Due to the semiannual sampling schedule in 1991, wells C-1, C-2, C-6, C-9, C-11, C-12, C-13, C-15, C-16, and C-19 were not sampled during April, September, or October 1991. Alton (1991a, 1991b, 1992) reported that the groundwater flow direction was toward the west during these monitoring events.

GTI conducted quarterly groundwater sampling for Chevron in July and October 1992; January, March, April (due to blank contamination in the March samples, they had to resample in April), July, and October 1993; and January 1994 (GTI, 1992a, 1992b, 1993a, 1993b, 1993c, 1993d, 1994). The most recent groundwater monitoring report described sampling conducted in January 1994. GTI reported that wells C-14 and C-16 were not sampled in July 1993 due to heavy traffic, well C-14 was not sampled in October 1993 due to insufficient water in the well, and well C-18 was not sampled during October 1993 or January 1994 because it had been paved over during road work. TPH-G (up to 1,200,000 ppb) and BTEX (up to 14,000 ppb benzene, 25,000 ppb toluene, 3,900 ppb ethylbenzene, and 26,000 ppb xylenes) generally have been detected in the groundwater samples collected from wells C-1, C-2, C-5, C-6 through C-9, C-11, C-14, C-16, and C-17 (Table C-3). One or more of the following constituents have also been detected in groundwater samples collected from wells C-1 through C-19: 1,2-DCA;

methylene chloride; 1,1,1-TCA; 1,1,1-DCA; carbon disulfide; and vinyl chloride. The highest TPH-G and BTEX concentrations generally have been detected in groundwater samples collected from wells C-6, C-7, C-9, C-14, and C-17. GTI reported that the groundwater flow direction was generally toward the west and northwest during 1993 and 1994 (Figure C-2).

### **3. Regulatory Status and Other Issues**

EMCON reviewed agency files at Alameda County. The files included monitoring plans, tank integrity testing information, and groundwater sampling reports. Letters from Alameda County to Chevron indicated that Chevron was responsible for cleanup of contamination at the intersection. The agency required that groundwater remediation be initiated by Chevron, but no treatment system has been installed to date.

### **4. Supplemental Site Assessment Work**

On October 21, 1994, EMCON conducted supplemental assessment activities at the site. These activities consisted of advancing three exploratory soil borings (THP-1 through THP-3) near the pump islands, UST complex, and waste oil UST (Figure A-1), and checking the fuel dispensers for the presence of spill containment boxes and for indications of possible leakage. Spill containment boxes were not observed beneath the four dispensers on site. Stained pea gravel backfill material was observed below the southwest dispenser. PID readings up to 151 ppm were obtained from pea gravel backfill material below each dispenser.

Soil borings THP-1 and THP-3 were advanced to approximately 22 to 23 feet bgs by using CPT equipment. Soil boring THP-2 was advanced to 8 feet bgs. CPT rig refusal was encountered at the total depth of each of the borings. Soil types encountered in the borings included mixtures of clay, silt, and sand to the total depth of each boring. PID readings obtained from soil samples collected from the borings ranged from nondetect to 3.1 ppm. Groundwater was encountered in THP-1 and THP-3 at approximately 18 and 17 feet bgs, respectively.

Two soil samples per boring were selected for laboratory analysis of TPH-G, TPH-D, TPH-O, and BTEX. None of the constituents analyzed for was detected in the analyzed soil samples (Table A-1). Groundwater samples collected from borings THP-1 and THP-3 by using HydroPunch™ equipment were submitted for laboratory analysis of TPH-G, TPH-D, TPH-O, and BTEX. Ethylbenzene (0.8 ppb) and xylenes (4 ppb) were detected in the groundwater sample collected from THP-1 (Table A-1).

Soil grab samples collected below the fuel dispensers were analyzed for TPH-G, TPH-D, TPH-O, and BTEX. TPH-G (up to 79 ppm), TPH-D (up to 360 ppm), and one or more BTEX constituents (up to 0.14 ppm toluene, 0.11 ppm ethylbenzene, and 0.80 ppm xylenes) were detected in each of the dispenser grab samples (Table A-1).

## **5. Baseline Summary**

A review of the most recent relevant data available in existing files, observations made during site visits, and data collected during the environmental investigations performed in accordance with the BP/Tosco purchase agreement have determined the presence of hazardous substance contamination in the soil and groundwater at this site. Such review has further determined evidence of contamination and sources of contamination which could result in the presence of hazardous substance contamination not yet detected.

Although the complete extent of contamination is not known at this time, there is sufficient evidence to demonstrate that the site was contaminated before the time of Tosco's purchase. Areas at the site for which evidence of contamination exists are: the UST complex location, the waste oil UST location, the pump islands area, and the eastern portion of the site.

Soil samples collected from the former UST excavation, former waste oil UST excavations, and beneath the dispensers (TD-1 through TD-4) contained one or more of the following at concentrations above method detection limits: TPH-G, TPH-D, BTEX constituents, and methylene chloride.

Analysis of groundwater samples collected from on-site wells C-10, C-11, C-12, C-17, and C-19 and from boring THP-1 demonstrated the presence of one or more of the following at concentrations above method detection limits: TPH-G, TOG, BTEX constituents, and VOCs.

The extent of evidence of actual contamination levels present and the evidence of sources of contamination consists of:

- Soil and groundwater data as summarized earlier in this report and detailed in existing files.
- The presence of on-site groundwater monitoring wells, groundwater extraction wells, and a groundwater remediation system installed on behalf of Chevron.

In conclusion, existing and developed evidence establishes a contamination baseline consisting of the measured presence of hazardous substance contamination in soil and

groundwater and evidence of historic sources and/or releases of hazardous substances. This report establishes a contamination baseline consisting of:

1. Known areas of contamination from measured or observed direct evidence, and
2. On-site or off-site areas of contamination which have not yet been detected but which are associated with or are consistent with evidence of existing areas of contamination and historic releases of hazardous substances.

**Explanation:**

Elevations are expressed as feet above mean sea level.

TOC = Top of casing

WTE = Water table elevation (well elevation - (DTW - (SPT x 0.8)))

DTW = Depth to water

SPT = Separate-phase hydrocarbon thickness

TPH-G = Total Petroleum Hydrocarbons as Gasoline (ppb)

TOG = Total Oil & Grease (EPA Method 503D & 503E)

\* = Rinseate sample contaminated; resampled 03/26/93

\*\* = Uncategorized compound not included in gasoline hydrocarbon total

\*\*\* = Hydrocarbon pattern uncharacteristic of fresh gasoline

# = Not enough water to purge and sample

PCE = Tetrachloroethene

1,2-DCA = 1,2-Dichloroethene

MC = Methylene Chloride

TCA = 1,1,1-Trichloroethane

1,1-DCA = 1,1-Dichloroethane

ND = Not detected at or above the minimum quantitation limit (MQL)

-- = Not sampled, not monitored, inaccessible

OTHER = 5 ppb Carbon Disulfide detected in C-1 on 10/13/89

3 ppb Vinyl Chloride detected in C-14 on 1/3/90

1 ppb Vinyl Chloride detected in C-14 on 1/4/90

13 ppb Carbon Disulfide detected in C-19 on 10/13/89

Re: **TOSCO #11128/Project #0952-041.02**

Dear Mike:

Enclosed are the results of the samples submitted to our lab on October 26, 1994. For your reference, these analyses have been assigned our service request number L943337.

All analyses were performed in accordance with our laboratory's quality assurance program. Golden State / CAS is certified for environmental analyses by the California Department of Health Services (Certificate # 1296/Expiration - December 1994).

Please call if you have any questions.

Respectfully submitted,

**Golden State / CAS Laboratories, Inc.**

Bothell, WA 98011

NOV 29 1994

Re: TOSCO # 11128 / 0952-041.02

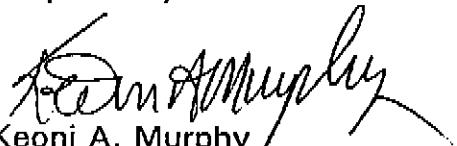

Dear Mr. Noll:

Attached are the results of the water samples submitted to our lab on October 24, 1994. For your reference, these analyses have been assigned our service request number S941286.

All analyses were performed consistent with our laboratory's quality assurance program. All results are intended to be considered in their entirety, and CAS is not responsible for use of less than the complete report. Results apply only to the samples analyzed.

Please call if you have any questions.

Respectfully submitted:

  
Keoni A. Murphy

## Acronyms

ASTM	American Society for Testing and Materials
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
NAN	Not Analyzed
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected at or above the MRL
NR	Not Requested
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
VPH	Volatile Petroleum Hydrocarbons
