SUBJECT: Summary Report
Phase II Site Investigation Findings
The Papermill
Emeryville, California

PROJECT NO.: 1075.001.02

PES Environmental, Inc. (PES) has completed a limited Phase II soil and groundwater sampling investigation at the Papermill site in Emeryville, California. The findings of the investigation indicate that subsurface conditions at the site are generally suitable for residential development provided several identified issues are addressed, as discussed below. Soil and groundwater sample results are summarized on Tables 1 and 2, respectively. Sample locations are depicted on Plate 1. Laboratory reports are also attached.

SUMMARY OF FINDINGS

Former Underground Storage Tank Area

A previous soil and groundwater investigation conducted in 1998 near the water tower and at the location of two former gasoline underground storage tanks (USTs) removed in 1969 documented a limited release of petroleum hydrocarbons to soil and groundwater (Ceres, 1998). As noted by Ceres, native clayey soils which surround the former UST excavation (and likely underlie most of the area) appear to have confined the bulk of the soil and groundwater contamination to within the limits of the excavation itself. Ceres' groundwater samples were collected at depths of 8 to 27 feet below ground surface (bgs).

The highest concentration of TPHg in groundwater (560 micrograms per liter; µg/l) was found in the water sample collected at 8 feet bgs, within the sandy backfill material of the former UST excavation. As discussed in our Phase I report (PES, 2006), PES reviewed Ceres' report and noted that soil concentrations were below RWQCB Environmental Screening Levels

Mr. Mike Kim
May 17, 2006
Page 2

(ESLs) and groundwater concentrations were above the TPHg ESL in two of five groundwater samples.

On April 4, 2006, PES, in conjunction with geotechnical sampling conducted by TRC Lowney, attempted to collect groundwater samples to establish if prior detections of hydrocarbons had decreased since last sampled in 1998 and to collect groundwater samples from other areas of the site. Unfortunately, all of the locations that were sampled yielded dry holes or insufficient water from which to collect samples for laboratory analysis.

PES reviewed CPT logs prepared by Gregg Drilling for TRC Lowney and identified a relatively continuous sandy zone (likely water bearing) at approximately 40 feet bgs. On April 28, 2006, PES collected soil samples from two borings at the former UST area and from groundwater downgradient of the former UST area. Soil boring SB-15 was completed within the former UST backfill material and sampled at depths of 7 feet bgs (within the backfill) and 11 feet bgs, below the excavation fill. Soil boring SB-16 was completed outside of the former UST backfill area (approximately 25 feet south of boring SB-16); samples were collected at 7 and 11 feet bgs. In the sample collected from boring SB-15 at 7 feet bgs (SB-15-7), TPHg and TPHd were detected at 380 milligrams per kilogram (mg/kg) and 540 mg/kg, respectively, above the residential ESL of 100 mg/kg. TPHmo was also detected at a concentration of 140 mg/kg, but below the residential ESL of 500 mg/kg. No VOCs were detected in the sample, though detection limits were raised because of the hydrocarbon presence. No hydrocarbons or VOCs were detected in the sample collected at 11 feet bgs from boring SB-15 or in the two samples collected from SB-16. These data indicate that petroleum hydrocarbons are present in the backfill materials of the former UST excavation at concentrations that exceed the prior Ceres results and the residential ESL. The data are consistent with the prior Ceres finding of petroleum hydrocarbon contamination confined within the former UST backfill material.

Groundwater samples were collected at locations GW-4 and GW-5, adjacent and downgradient of the former USTs. No TPHd, TPHmo, or TPHg were detected in groundwater at GW-4. Toluene was detected in GW-4 at a concentration of 0.68 µg/l, well below the ESL of 40 µg/l, TPHg and toluene were detected at GW-5 at concentrations of 49 µg/l and 0.63 µg/l, respectively, below the ESLs. Acetone and chloroform were also detected in the sample from GW-5 at concentrations of 50 and 11 µg/l, respectively, below the ESLs. Groundwater samples were also collected from locations further downgradient/cross gradient at locations GW-1, GW-2, and GW-3. No TPHd, TPHmo, or TPHg were detected in these samples. Low concentrations of toluene were detected groundwater collected from GW-1 (0.61 µg/l), below the ESL. As discussed in more detail below, a C10-C30 hydrocarbon was detected on the TPHd analysis in all five of the groundwater samples, however, no diesel pattern was present.

Mr. Mike Kim
May 17, 2006
Page 3

On a preliminary basis, it is our opinion that the petroleum residuals in soil at the former UST excavation (in excess of residential ESLs) can be addressed via a soil management plan that would specify removal and appropriate disposal of the contaminated soil as part of site redevelopment activities. Assuming the affected area encompasses the former excavation area (estimated to be approximately 30 feet by 50 feet, down to a depth of about 11 feet bgs, this would equate to approximately 600 cubic yards. Converted to tons, this roughly equates to about 900 tons of hydrocarbon-contaminated soil. Assuming all of the soils are Class II soils (non-hazardous) and transportation and disposal cost of \$59/ton, the preliminary cost for excavating and disposing of this soil, sampling and analysis, permitting and engineering oversight, etc. would be in the ±\$100,000 range. Further characterization to better delineate the extent can be performed to further constrain this estimate.

Lead in Soil

A previous shallow soil investigation was conducted in 2002 beneath a portion of the Powell Street building, in preparation for future renovation activities (Anton Geological, 2002). Four shallow soil samples (S1 through S4) were collected along a north/south line located in the west central portion of the building. Samples were collected from the upper 12 inches of soil. Lead was detected in the three southernmost samples (S3, S2, S1) at concentrations of 50, 130 and 150 mg/kg, at or below the residential ESL of 150 mg/kg. The northernmost sample (S4) had a lead concentration of 2,700 mg/kg that exceeds the residential ESL and the Total Threshold Limit Concentration (TTLC) criteria of 1,000 mg/kg for hazardous waste.

To further evaluate the distribution of lead in soil, PES collected additional shallow soil samples: (1) at 0.5 and 1.0 feet bgs from 6 locations (SB-1 through SB-6) within the Powell Street building; and (2) at eight borings (SB-7 through SB-14) located within the parking lot between the Powell Street and Hollis Street buildings and within the Hollis Street Building, at depths of 1.5 feet bgs. Soil samples were analyzed for the heavy metals arsenic, barium, cadmium, chromium, lead, selenium, silver, and mercury. Lead was detected in two soil samples (SB-1 and SB-4, located at the northeastern and southwestern portions of the building) at 1.0 feet bgs, at concentrations (730 and 270 mg/kg) above the residential ESL.

Thus lead is present in shallow soils (at ~1.0 feet bgs) within the Powell Street building footprint at concentrations that exceed the residential ESL. Roughly speaking, the northern half of the building (i.e., the area around SB-1 and S4) and the southwestern corner around SB-4 have concentrations above the ESL.

Other metals, arsenic, barium, chromium and mercury were also detected. However, concentrations were either below residential ESLs (i.e., for arsenic, barium, chromium and

Mr. Mike Kim
May 17, 2006
Page 4

mercury) or were within the anticipated range of background concentrations of metals in soils (for arsenic and chromium).¹

As for the hydrocarbon soil, PES believes that lead soil contamination at the Powell Street building (above residential ESLs) can be addressed via a soil management plan that would specify removal and proper disposal of the contaminated soils as part of site redevelopment activities. Assuming the affected area encompasses the northern half of the building and the southwestern corner (total of approximately 32,250 square feet) and that the lead contamination extends to a depth of 2 feet bgs, the excavation volume would equate to approximately 1,600 cubic yards. Converted to tons (using a 1.5 tons per cy conversion factor), this equates to 2,400 tons. At a typical non-RCRA California Hazardous Waste soil transportation and disposal fee of \$130 per ton, this would equate to costs of about \$342,000 (excluding excavation, engineering, confirmation sampling and analysis, etc.). Further refinement of the extent of the problem could be done upon building demolition, as the current crawlspace limits effective sampling.

Perchloroethylene Detection in Soil

Perchloroethylene (PCE) was detected in a shallow soil sample (SB-12-1.5) collected near the northeastern corner of the Hollis Street building. While the concentration of PCE was low (10 µg/kg) and below the residential ESL, it is not clear if the detection represents an isolated occurrence or a more significant and widespread VOC problem. Because PCE has been used in printing and silk-screening (tenant activities), it is possible the PCE is related to site activities. Further characterization is warranted.

Groundwater Conditions

Finally, as mentioned above, with the exception of the TPHg, acetone, chloroform and toluene detections, no other specific compounds were detected in the groundwater. However, the laboratory noted that hydrocarbons in the C10-C30 range were detected (at concentrations of 70-230 ppb) in all of the groundwater samples run for TPHd. The hydrocarbons were not diesel, however. The source and specific compound name of these compounds is unknown. Compared to the ESLs, three of the five groundwater samples exceed the groundwater ESL for TPH (middle distillates; 100 µg/l). In an effort to identify the compounds, PES directed the laboratory to run two of the groundwater samples for semivolatile compounds (SVOC) by EPA

¹ Local background soil concentrations of metal were compared to the range of background metals concentrations established by Lawrence Berkeley National Laboratory in 1995 (LBNL, 1995. *Protocol for Determining Background Concentrations of Metals in Soil at Lawrence Berkeley National Laboratory (LBNL)*)). For example, the maximum arsenic and chromium concentrations detected at the Papermill were 8.3 and 110 mg/kg. The range of LBNL arsenic concentrations were 9.3 to 31.0 mg/kg; for chromium, 59.0 to 142.2 mg/kg. Thus the detection of arsenic and chromium above ESLs is attributed to natural background conditions.

Mr. Mike Kim
May 17, 2006
Page 5

Test Method 8270. No SVOCs were detected in the samples. Review of the TPHd chromatograms indicates the hydrocarbon compounds could represent the heavy residuals left over from degradation of gasoline (i.e., the heavier fractions of gasoline that are less readily degradable). The highest concentration (230 µg/l) of these hydrocarbons was found at location GW-5, downgradient/crossgradient of the former gasoline USTs. While this might suggest the former USTs are the source of the hydrocarbons in groundwater, recall that soil contamination at the location of the tanks was not significant, except within the former UST excavation backfill materials; the underlying soils were not contaminated. Alternatively, the source of the hydrocarbons may be upgradient off-site areas where petroleum hydrocarbons were stored, such as the possible historical (late 1950s and 1960s) gas station located at the current Boyd's Body Shop, some 50 feet upgradient of the eastern property boundary.

Resolution of the source and nature of these hydrocarbons in groundwater should be addressed by further characterization.

SUMMARY

- 1) The soil and groundwater data look relatively good with respect to the planned residential development. A few identified issues require resolution.
- 2) Petroleum Hydrocarbons and lead in soil can be managed via a soil management plan. More testing should be done so that the costs to implement the program can be reasonably estimated within context of the transaction.
- 3) Additional data collection is needed to document the isolated hit of PCE in soil to confirm that the detection is not indicative of a more substantial VOC issue.
- 4) Groundwater is likely not an issue, but additional data regarding the unknown hydrocarbon in groundwater should be collected so that this issue can be put to rest.
- 5) Data collection to resolve these matters can be accomplished over an approximately 4-week period.

Certificate of Analysis - Final Report

On April 28, 2006, samples were received under chain of custody for analysis.

Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Solid	EPA 8260B Mercury - EPA 7471B Metals by ICP EPA 6010B PCBs by EPA 8082A TPH-Extractable by EPA 8015M w/SGCU TPH-Purgeable by GC/MS

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).
If you have any questions regarding this report, please call us at 408-588-0200 ext. 225.

Sincerely,

Laurie Glantz-Murphy

Subject: FW: Hydrocarbon detections in the diesel range - Papermill site

Simon - please disregard the earlier email. Instead, please run the water samples from: 1) Lab #49201-007 (Sample ID:GW-3-42); and 2) Lab #49201-008 (Sample ID: GW-4-42) for 8270 (SVOCs). Also, what are the detection limits for the PCBs part of the 8270? Will they be low enough to meet the ~170 ppb found in the diesel analysis?

*49201 change order / client knows samples
Thanks, ave out of it. Also, client does not need PCB
Carl analysis. J.25 + 8270 2 day TAT*

Simon - please run the water samples from two samples: 1) Lab #49201-013 (Sample ID:GW-5-42) and 2) Lab #49201-007 (Sample ID:GW-3-42) for 8270 (SVOCs) and 8081 (organochlorine pesticides). Also, what are the detection limits for the PCBs part of the 8270? Will they be low enough to meet the ~170 ppb found in the diesel analysis?

Nothing showed on the TIC reports.

I will be out of the lab tomorrow (Weds 5/9). If you want to order more analyses, please contact Simon Hague. (shague@entechlabs.com)

Thanks;
