Remediation Status Report – First Quarter 2017
SWISS VALLEY CLEANERS

1.0. INTRODUCTION

At the request of Mr. William Mathew Brooks of Ardenbrook, Inc., Advanced GeoEnvironmental, Inc. (AGE) has prepared this, *Remediation Status Report – First Quarter 2017*, for the Swiss Valley Cleaners site located at 1395 MacArthur Boulevard, San Leandro, California (site). This report documents remedial operation and maintenance of the soil-vapor extraction during the First Quarter 2017. The location of the site is illustrated in Figure 1. A plot plan of the site, SVE wells and trenching locations are illustrated in Figure 2. Well construction details are included as Table 1.

On 11 November 2016, the SVE system began operation under Bay Area Air Quality Management District (BAAQMD) permit application number 28042, plant number 23608. SVE commenced on 11 November 2016 utilizing well network VW-1 through VW-21.

2.0. REMEDIAL OPERATION PROCEDURES

Remedial piping is routed to a moisture knockout vessel and two 1,000-pound granular activated carbon (GAC) vessels and then to a positive displacement blower capable of producing 150 standard cubic feet per minute (scfm). Sampling ports have been installed upstream of the vacuum blower inlet to recover influent soil-vapor stream samples, and downstream of the GAC vessels to recover effluent vapor stream samples to monitor the efficiency of contaminant destruction.

The SVE system was typically monitored on a weekly basis and sampled on a monthly basis. During startup activities the remedial system was monitored daily for the first week of operation.

In order to monitor efficiency of the SVE petroleum vapor recovery system, the following steps were taken: 1) a Magnehelic® vacuum gauge and Dwyer® DS-200 differential pressure sensor were installed before the blower so that the total air flow rate was monitored; the flow rate was determined from the measured differential pressure and the piping diameter using a nomograph; 2) SVE air flow of the influent and effluent streams were monitored routinely for the presence of organic vapor using a Rae® Systems MiniRae3000 organic vapor meter (OVM) equipped with a photo ionization detector (PID-10.6 eV lamp); and 3) influent and effluent vapor flow vapor stream samples were collected from sampling ports installed upstream (influent) of the SVE blower and downstream (effluent) of the carbon treatment system and submitted for laboratory analysis as required by the BAAQMD Permit to Operate (PTO).

Numerous operational parameters are recorded or displayed on the system, including: operational and cumulative system hours (SVE); air temperature after the blower; vacuum generated by the blower; flow of SVE vapor stream; influent OVM readings taken before and after the blower, at each of the carbon vessels, and effluent readings downstream of the carbon treatment system. Table 2 lists each of the parameters measured evaluate system performance and trends.

Additionally, the SVE well network consists of twenty-one shallow screened SVE wells (VW-1 through VW-21) screened from 2 feet to 7 feet bsg. Each well is fitted with a ball valve to allow individual well adjustments. During this operational period all wells were utilized for SVE remediation (Table 2).

During this operational period influent and effluent vapor samples were collected on 19 January, 21 February and 15 March 2017. Samples were collected using a vacuum pump and lung box into Tedlar bags. Samples were submitted to a California Department of Public Health certified laboratory for analysis of full-scan Volatile Organic Compounds (VOCs). Analytical results are included as Appendix A.

3.0. REMEDIAL OPERATION FINDINGS

Data collected during startup and the first quarter 2017 operation and monitoring events as well as vapor stream sampling was used to determine the efficiency and effectiveness of the on-site remedial SVE system. The following is a summary of findings from the first quarter 2017 operational period.

As of 22 March 2017, the SVE system has been in operation for 2,668.5 hours (equivalent to 112 days). During the first quarter 2017 (27 December and 15 March), the system operated for 1,737.2 hours

The SVE system flow ranged from 168 standard cubic feet per min (scfm) to 200 scfm. System vacuum has been regulated between 6 inches of water to 15 inches of water during the quarter. PID system influent readings were collected from sampling ports before (influent) and after (effluent) the blower during this quarter. Influent readings ranged from 1.3 parts per million by volume (ppmv) to 8 ppmv. Effluent readings were measured at 0.0 ppmv. SVE system parameters are summarized in Table 2.

Influent and effluent vapor samples were collected on 19 January, 21 February and 15 March 2017. Tetrachloroethene (PCE) was detected in three influent samples at concentrations ranging from 2,000 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and 8,900 $\mu\text{g}/\text{m}^3$. Constituents of concern were not reported above laboratory reporting limits in any of the effluent samples collected during the first quarter 2017.

No other analytes of concern were reported above laboratory detection limits in the samples collected during the fourth quarter 2016 operational period. SVE influent and effluent samples collected this quarter are summarized in Table 3. The laboratory reports

(McCampbell Analytical Work Order Nos. 1701740, 1701A14 and 1703750), QA/QC report and chain of custody form are included in Appendix A. The laboratory electronic deliverable format files were QA/QC checked and uploaded to the State Water Board GeoTracker site under confirmation numbers 2423194587, 7729179084 and 7804847419.

MASS REMOVAL

Between 15 December 2016 and 15 March 2017 the SVE unit operated a total of 1,685.1 hours, for the estimation of contaminant mass removal (Table 2). The average analytical results of the influent SVE flow samples, average influent flow rates and the operational periods (i.e. between sampling events) were used to calculate the approximate mass of extracted PCE during this period. During the first quarter 2017, approximately 4.6 pounds of PCE were removed from the soil vapor at the site using SVE remediation. Mass and volume calculations are included in Appendix B.

4.0. CONCLUSIONS

Based upon the data presented in this report, AGE concludes:

- SVE remediation generally operated without down-time during the first quarter 2017 (Table 2);
- PCE was detected at low concentrations in all three influent samples during the first quarter 2017 remediation period. Influent concentrations now appear to be reaching asymptotic levels (see trend graph in Appendix C) and rebound testing should now be considered. Additionally, indoor air concentrations should be evaluated within and in adjacent suites while the system is non-operational to gauge “current” concentrations.
- The total system flow and vacuum observed during the first quarter 2017 is adequate to remove the chlorinated hydrocarbon mass present at the site; and
- Between 15 December 2016 and 15 March 2017, approximately 4.6 pounds of PCE were removed from the shallow subsurface (Appendix B).
- Field measurements of influent sampling and from individual soil-vapor wells indicate that a sufficient PCE mass was removed as a result of SVE operations conducted at the site during the first quarter 2017.

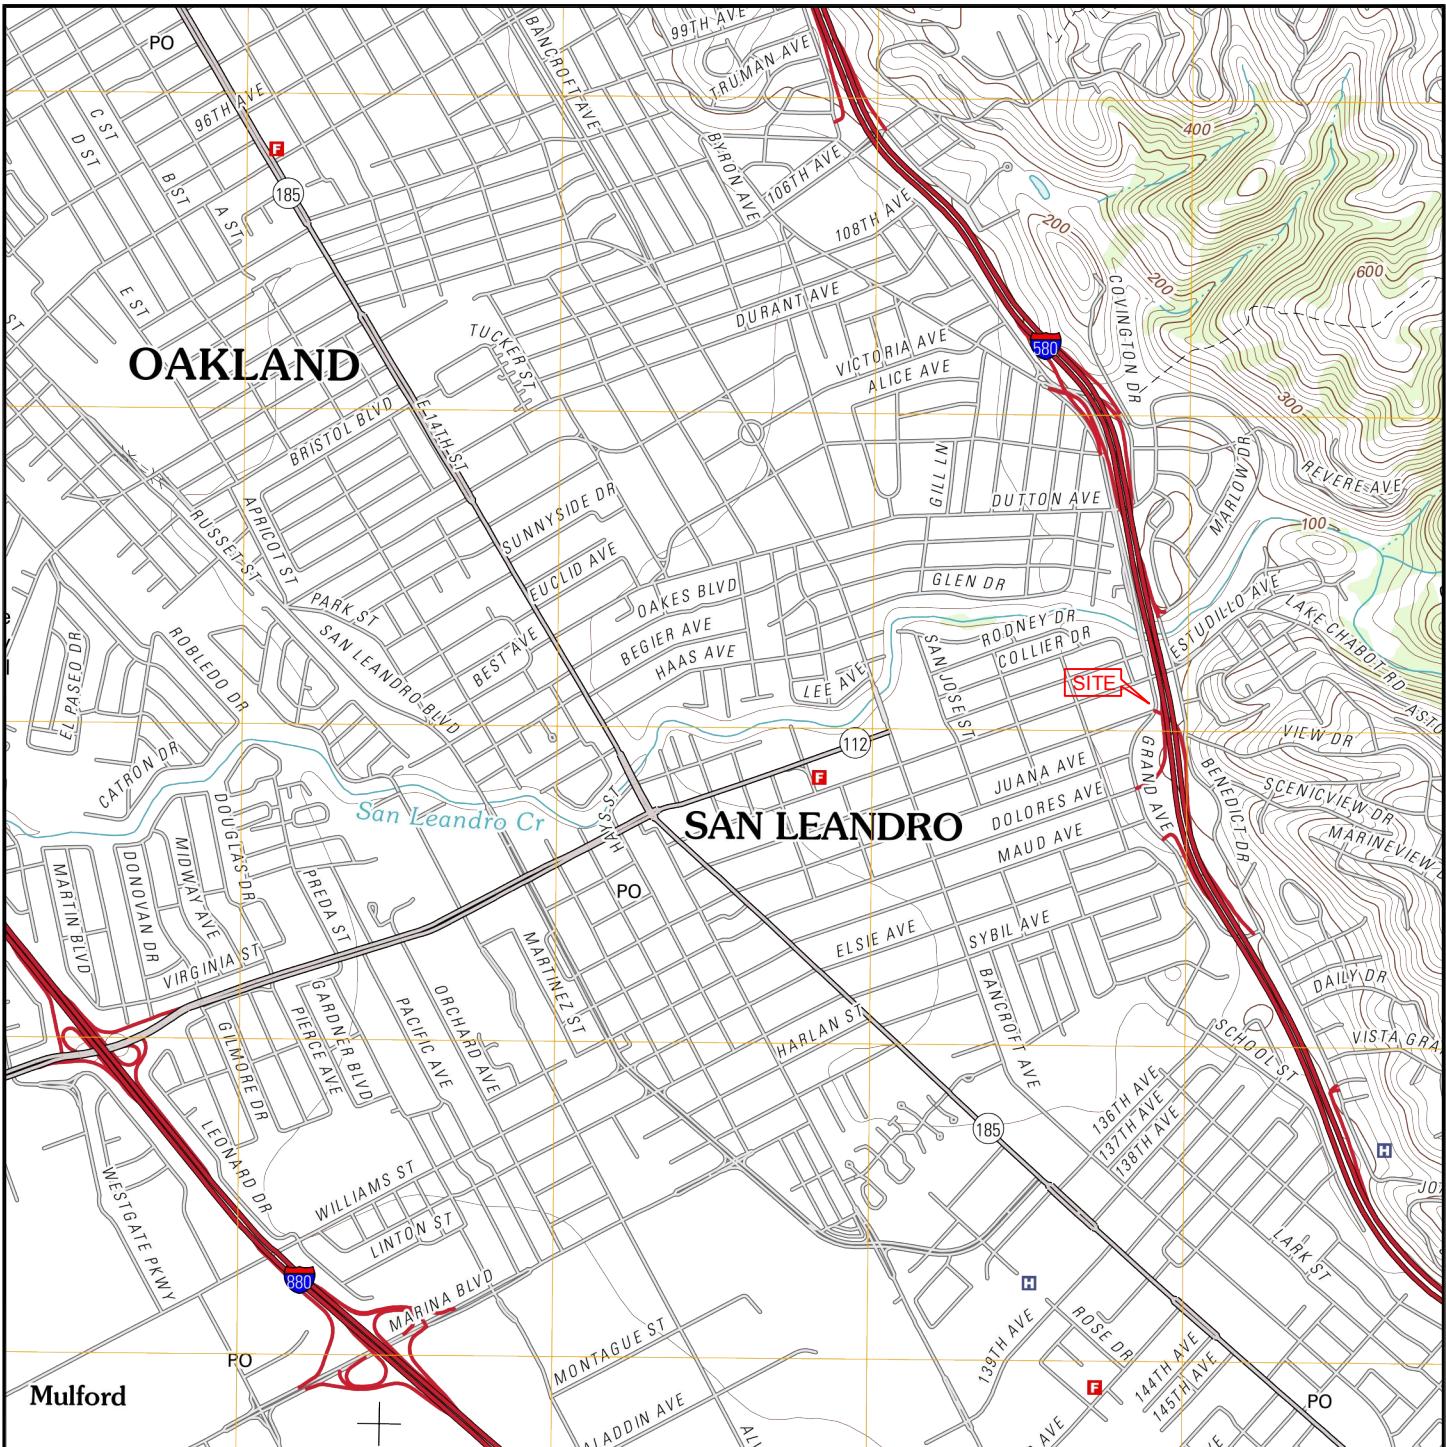

5.0. RECOMMENDATIONS

Based on the findings of the environmental activities performed to date at the site, AGE recommends suspension of operation of the SVE system starting in April 2017. The suspension time will be used to evaluate rebound of PCE impact to the subsurface and indoor air.

6.0. LIMITATIONS

Our professional services were performed using that degree of care and skill ordinarily exercised by environmental consultants practicing in this or similar localities. Findings were based upon analytical results provided by an independent laboratory. Evaluation of the geologic/hydrogeologic conditions at the site for the purpose of this investigation was made from a limited number of available data points (soil-vapor samples) and subsurface conditions may vary away from these data points. No other warranty, expressed or implied, is made as to the professional interpretations, opinions, and recommendations contained in this report.

APPENDIX B
MASS-VOLUME CALCULATIONS
 Swiss Valley Cleaners
 1395 MacArthur Boulevard
 San Leandro, California

$$M = C \times Q \times t$$

C = vapor concentration (kg/m^3)

To convert, multiply by: 0.000001

Q = extraction flow rate (m^3/hr)

To convert, multiply by: 60 min/hr

t = operational period (hrs)

and: 0.0283168 m^3/ft^3

$$M(\text{kg}) = (\text{Avg concentration})(0.000001) \times [\text{flow}(\text{ft}^3/\text{min})](60 \text{ min/hr})(0.0283168 \text{ m}^3/\text{ft}^3) \times \text{time}(hrs)$$

Converting kg of M to lbs of M, multiply by: 2.2046 lbs/kg

Converting lbs of M to gal of M, multiply by: 0.074 gal/lb
