Mr. Mark Detterman
Alameda County Environmental Health
1131 Harbor Bay Parkway, Suite 250
Alameda, CA 94502

Dear Mr. Detterman:

Attached for your review is the *Second Quarter 2014 Semi-Annual Groundwater Monitoring and LNAPL Recovery Status Report* for Chevron-branded service station 90504, located at 15900 Hesperian Boulevard in San Lorenzo, California. This report was prepared by Stantec Consulting Services Inc. (Stantec), upon whose assistance and advice I have relied. I declare under penalty of perjury that the information and/or recommendations contained in the attached report are true and correct, to the best of my knowledge.

If you should have any further questions, please do not hesitate to contact me or the Stantec project manager, Travis Flora, at (408) 356-6124 ext. 238, or travis.flora@stantec.com.

Sincerely,

A handwritten signature in black ink that reads "Carryl MacLeod".

Carryl MacLeod
Project Manager

Reference: **Second Quarter 2014 Semi-Annual Groundwater Monitoring and LNAPL Recovery Status Report**
Chevron-branded Service Station 90504
15900 Hesperian Boulevard, San Lorenzo, California

Dear Mr. Detterman:

On behalf of Chevron Environmental Management Company (Chevron), Stantec Consulting Services Inc. (Stantec) is pleased to submit the Second Quarter 2014 Semi-Annual Groundwater Monitoring and LNAPL Recovery Status Report for Chevron-branded service station 90504, which is located at 15900 Hesperian Boulevard, San Lorenzo, Alameda County, California (the Site - shown on **Figure 1**). This report is presented in four sections: Site Background, Second Quarter 2014 Groundwater Monitoring and Sampling Program, light non-aqueous phase liquid (LNAPL) Recovery, and Conclusions and Recommendations.

SITE BACKGROUND

The Site is an active Chevron-branded service station located on the eastern corner at the intersection of Hesperian Boulevard and Post Office Road in San Lorenzo, California. The Site has been occupied by a gasoline service station since approximately 1969. Current Site features include three 10,000-gallon fiberglass gasoline underground storage tanks (USTs), one 10,000-gallon fiberglass diesel UST, three fuel dispenser islands, and a station building with three service bays. The USTs are located in the southern portion of the Site, the fuel dispenser islands are located in the central portion of the Site, and the station building is located in the northeastern portion of the Site. In 1983, two 10,000-gallon and one 5,000-gallon steel USTs were replaced with the current fiberglass tanks. In January 1994, the fuel dispenser islands were replaced, and in March 1994, a 1,000-gallon steel waste oil UST located northeast of the station building was replaced with a 1,000-gallon fiberglass UST, which was later removed in 2001.

Land use near the Site consists primarily of commercial and residential properties. The Site is bounded on the northwest by Post Office Road, to the northeast by a parking lot for the post office, to the southeast by a commercial building, and on the southwest by Hesperian Boulevard.

In an email dated October 10, 2013, Alameda County Environmental Health (ACEH) requested a Site Conceptual Model (SCM) that identifies Site data gaps, evaluates potential conduits (utilities and wells), evaluates the Site under the Low-Threat UST Case Closure Policy (LTCP), and includes a data gap work plan, as needed.

SECOND QUARTER 2014 SEMI-ANNUAL GROUNDWATER MONITORING AND LNAPL RECOVERY STATUS REPORT

Chevron-branded Service Station 90504

September 12, 2014

Page 2 of 8

Stantec submitted the SCM to ACEH on April 28, 2014. Recommendations from the report include the following:

- Work with Chevron and the service station owner/operator to obtain information on the source mechanism, location, and volume of the LNAPL release in 2012;
- Once information on the mechanism, location, and volume of the LNAPL release is obtained, prepare a work plan for an on-site soil assessment to define the soil source area based on the specific release information, and determine if secondary source removal is needed;
- The proposed work plan will also include advancement of one off-site soil boring and collection of a representative groundwater sample to define the dissolved-phase petroleum hydrocarbon plume southwest (down-gradient) of well C-2; and
- During Second Quarter 2014, request full-range carbon chain (C_6 to C_{40}) analysis on all groundwater samples collected to more accurately identify the specific petroleum hydrocarbon constituents in groundwater and to evaluate whether total petroleum hydrocarbons as motor oil (TPH-MO) should continue to be considered a constituent of concern (COC).

In a letter dated July 7, 2014, ACEH provided technical comments on the SCM and requested a data gap work plan be prepared to address those comments by September 12, 2014. Total petroleum hydrocarbons (TPH) C_{13} to C_{40} (TPH C13-C40) analysis was added for all Site wells in Second Quarter 2014.

SECOND QUARTER 2014 GROUNDWATER MONITORING AND SAMPLING PROGRAM

Gettler-Ryan Inc. (G-R) performed the Second Quarter 2014 groundwater monitoring and sampling event on June 25, 2014. G-R's standard operating procedures (SOPs) and field data sheets are included in **Attachment A**. G-R gauged depth-to-groundwater in 10 Site wells (C-1 through C-3 and C-5 through C-11) prior to collecting groundwater samples for laboratory analysis. All 10 wells were sampled this quarter. LNAPL was not noted in any Site well during the sampling event. Well C-4 was not monitored or sampled this quarter as it was inaccessible. The well appeared to be filled with concrete.

Investigation-derived waste (IDW) generated during the Second Quarter 2014 groundwater monitoring and sampling event was transported by Clean Harbors Environmental Services to Seaport Environmental in Redwood City, California.

Groundwater Elevation and Gradient

Well construction details and a screen interval assessment for all Site wells monitored this quarter are presented in **Table 1**. Wells C-1 through C-3 and C-5 through C-8 are currently screened across the prevailing groundwater table, while the groundwater elevations in wells C-9 through C-11 were measured above the upper screen interval, and the screen intervals are currently entirely submerged. Current and historical groundwater elevation data are presented in **Table 2**. A groundwater elevation contour map (based on Second Quarter 2014 data) is shown on **Figure 2**. The direction of groundwater flow at the time of sampling was generally towards the southwest at an approximate hydraulic gradient ranging from 0.003 to 0.014 feet per foot (ft/ft). This is generally consistent with the historical direction of groundwater flow, as shown by the Groundwater Flow Direction Rose Diagram on **Figure 3** illustrating the predominant southwest direction of groundwater flow from Fourth Quarter 1989 to present.

SECOND QUARTER 2014 SEMI-ANNUAL GROUNDWATER MONITORING AND LNAPL RECOVERY STATUS REPORT

Chevron-branded Service Station 90504

Page 3 of 8

Schedule of Laboratory Analysis

Groundwater samples were collected and analyzed for TPH as gasoline range organics (TPH-GRO), TPH as diesel range organics (TPH-DRO) with silica gel cleanup, and TPH C₁₃-C₄₀ using United States Environmental Protection Agency (US EPA) Method 8015B (SW-846). Benzene, toluene, ethylbenzene, and total xylenes (BTEX compounds) and naphthalene were analyzed using US EPA Method 8260B (SW-846). In addition, the laboratory reported total TPH for internal quality assurance/quality control purposes.

Groundwater Analytical Results

During the Second Quarter 2014 event, groundwater samples were collected from 10 Site wells (C-1 through C-3 and C-5 through C-11). Current and historical groundwater analytical results are included in **Table 2** and **Table 3**. A figure showing the latest groundwater analytical data plotted on a Site map is included as **Figure 4**. A TPH-GRO isoconcentration map is shown on **Figure 5**. A TPH-DRO (with silica gel cleanup) isoconcentration map is shown on **Figure 6**. An isoconcentration map was not developed for benzene because concentrations were below the California Regional Water Quality Control Board – San Francisco Bay Region Environmental Screening Level (ESL) of 1 microgram per liter ($\mu\text{g/L}$) in all Site wells sampled.

Certified laboratory analysis reports and chain-of-custody documents are presented as **Attachment B**. Hydrographs based on current and historical groundwater elevations and analytical results are included in **Attachment C**. A summary of Second Quarter 2014 groundwater analytical results follows. Historical trends were not evaluated for TPH C₁₃-C₄₀ and naphthalene as they were recently added to the groundwater sampling program and limited data are available.

- **TPH-GRO** was detected in two Site wells this quarter, at concentrations of 120 $\mu\text{g/L}$ (well C-2) and 9,100 $\mu\text{g/L}$ (well C-8), which are within historical limits for each respective well.
- **TPH-DRO (with silica gel cleanup)** was detected in two Site wells this quarter, at concentrations of 2,100 $\mu\text{g/L}$ (well C-8) and 3,000 $\mu\text{g/L}$ (well C-2). Concentrations are within historical limits for each respective well with the exception of well C-2, which is equal to the historical low.
- **Benzene** was detected in one Site well this quarter, at a concentration of 0.8 $\mu\text{g/L}$ (well C-8), which is within historical limits for this well.
- **Toluene** was not detected above method detection limits (MDLs) in any Site well sampled this quarter.
- **Ethylbenzene** was detected in one Site well this quarter, at a concentration of 26 $\mu\text{g/L}$ (well C-8), which is within historical limits for this well.
- **Total Xylenes** were detected in one Site well this quarter, at a concentration of 3 $\mu\text{g/L}$ (well C-8), which is within historical limits for this well.
- **Naphthalene** was detected in one Site well this quarter, at a concentration of 8 $\mu\text{g/L}$ (well C-8).

SECOND QUARTER 2014 SEMI-ANNUAL GROUNDWATER MONITORING AND LNAPL RECOVERY STATUS REPORT

Chevron-branded Service Station 90504

September 12, 2014

Page 4 of 8

LNAPL RECOVERY

In a letter dated July 13, 2012, ACEH requested continuing appropriate and timely efforts to abate and recover the LNAPL from well C-2 and a LNAPL recovery status report summarizing activities. The *LNAPL Recovery Status Report* was submitted on August 31, 2012, and described the LNAPL recovery efforts conducted during August 2012, which consisted of weekly monitoring of well C-2 and recovery of LNAPL, if present. A new absorbent sock was placed in the well following each recovery event. During August 2012, approximately 200 milliliters (mL) of LNAPL and approximately 5 liters (L) of total fluids (LNAPL and groundwater mixture) were recovered from well C-2.

Due to decreasing volume of LNAPL recovered in well C-2, the frequency of the LNAPL monitoring and recovery events was reduced from weekly to monthly. During Fourth Quarter 2012, First Quarter 2013, Second Quarter 2013, and Third Quarter 2013, LNAPL monitoring and recovery events were conducted monthly at well C-2. No LNAPL was measured during any of the events conducted during Fourth Quarter 2012 and First Quarter 2013. During Second Quarter 2013, no LNAPL was measured during events conducted in April and May 2013. Following the May 2013 event, Stantec proceeded with removal of the absorbent sock from well C-2 as recommended in the *First Quarter 2013 Quarterly Groundwater Monitoring and LNAPL Recovery Status Report*, dated May 31, 2013. During the June 2013 event, a LNAPL thickness of 0.01 feet was measured; however, no LNAPL or sheen was noted by G-R in well C-2 four days later on June 11, 2013, during the groundwater monitoring and sampling event. During Third Quarter 2013, no measurable LNAPL or sheen was observed during any of the events, and therefore, no LNAPL recovery was conducted; however, sheen was noted by G-R during the groundwater monitoring and sampling event on September 10, 2013. Quarterly LNAPL monitoring and recovery events were conducted in Fourth Quarter 2013 and First Quarter 2014 and no measurable LNAPL or sheen was observed; therefore, no LNAPL recovery was conducted. In addition, G-R did not observe measurable LNAPL or sheen during the Fourth Quarter 2013 or First Quarter 2014 groundwater monitoring and sampling events.

During Second Quarter 2014, Stantec conducted a quarterly LNAPL monitoring and recovery event at well C-2 on April 7, 2014. No measurable LNAPL or sheen was observed during the event, and therefore, no LNAPL recovery was conducted. Field data sheets for the LNAPL monitoring event are included in **Attachment D**. In addition, G-R did not observe measurable LNAPL or sheen at well C-2 during the June 25, 2014 groundwater monitoring and sampling event.

CONCLUSIONS AND RECOMMENDATIONS

Concentrations are conservatively compared to ESLs for groundwater that is a current or potential source of drinking water, and TPH-GRO, TPH-DRO, and naphthalene were observed above ESLs as follows:

- TPH-GRO concentrations exceed the ESL of 100 µg/L in wells C-2 and C-8;
- TPH-DRO concentrations (with silica gel cleanup) exceed the ESL of 100 µg/L in wells C-2 and C-8; and
- The naphthalene concentration exceeds the ESL of 6.1 µg/L in well C-8.

During Second Quarter 2014, maximum concentrations of TPH-GRO, benzene, ethylbenzene, total xylenes, and naphthalene were observed in off-site well C-8, located approximately

SECOND QUARTER 2014 SEMI-ANNUAL GROUNDWATER MONITORING AND LNAPL RECOVERY STATUS REPORT

Chevron-branded Service Station 90504

September 12, 2014

Page 5 of 8

100 feet down-gradient of the Site, and maximum concentrations of TPH-DRO (with silica gel cleanup). Well C-2 has been observed to contain measurable LNAPL as recently as June 2013, following removal of the absorbent sock from the well. Well C-8 is located approximately 110 feet down-gradient of well C-2, but has no history of measured LNAPL.

The dissolved-phase petroleum hydrocarbon plume appears to be stable to decreasing in overall size and concentration and is defined in all directions except potentially to the southwest (down-gradient) of well C-2. Because the dissolved-phase petroleum hydrocarbon plume may not be defined to the southwest of well C-2, current Site conditions do not satisfy any of the LTCP groundwater-specific criteria scenarios.

TPH C₁₃-C₄₀ analysis was conducted during Second Quarter 2014 to try and rule out TPH-MO as a COC because a direct release of diesel is suspected and there is no explanation for the occurrence of TPH-MO in groundwater at the Site. During Second Quarter 2014, TPH C₁₃-C₄₀ was reported in wells C-2 and C-8 at concentrations of 51,000 µg/L and 570 µg/L, respectively. These are approximately one order of magnitude higher than TPH-MO concentrations measured during First Quarter 2014. The TPH C₁₃-C₄₀ quantitation range has a substantial overlap with that of TPH-DRO (C₁₀ to C₂₈); therefore, it was expected that the TPH-DRO concentrations in each well would have increased between First and Second Quarter 2014 as well, but this did not occur.

Due to the unusually high TPH C₁₃-C₄₀ results, Chevron contacted Chevron Energy Technology Company (Chevron ETC) and requested an additional peer review of the field data, laboratory data, and chromatograms for the samples collected from wells C-2 and C-8 during Second Quarter 2014 and historical sampling events. The peer review concluded that the petroleum at well C-2 appears to be highly weathered diesel only, and the petroleum at well C-8 appears to be gasoline only.

The Chevron ETC peer review stated that the TPH-MO concentrations detected in well C-2 prior to the Second Quarter 2014 event are believed to be due to the quantitation range for motor oil (C₁₆ to C₃₆) having a substantial overlap with the quantitation range for diesel (C₁₀ to C₂₈). In addition, both the TPH-DRO and TPH-MO chromatograms show hydrocarbon peaks that are virtually insoluble, and it appears that the samples from well C-2 contained a non-dissolved product component associated with sample turbidity. Product/sheen has been observed in well C-2 relatively recently, and product was clearly present at the current depth-to-groundwater (and deeper) from 1989 to 1991; therefore, entrainment of a non-dissolved component via sample turbidity (micelles, petroleum affected soil particles, etc.) is expected. All wells are purged and sampled with bailers, which increases the sample turbidity. The sample turbidity in the samples collected from well C-2 is documented in the current and historical field sampling sheets from G-R that indicate "cloudy water" and "silt" in samples collected from well C-2.

The reason for the high concentrations of TPH C₁₃-C₄₀ in the sample collected from well C-2 during Second 2014 is believed to be due to the combination of the non-dissolved product component associated with sample turbidity and the fact that silica gel cleanup was not used for the TPH C₁₃-C₄₀ analysis. It is highly probable that a large polar component is present in well C-2 due to the biodegradation of the residual diesel, and silica gel cleanup would remove the polar compounds. During Second Quarter 2014, the TPH-DRO analysis was conducted using silica gel cleanup, and this is believed to be the reason the TPH-DRO results did not compare well with the TPH C₁₃-C₄₀ results. Because of the apparent unreliability of the TPH C₁₃-C₄₀ data, the

SECOND QUARTER 2014 SEMI-ANNUAL GROUNDWATER MONITORING AND LNAPL RECOVERY STATUS REPORT

Chevron-branded Service Station 90504

September 12, 2014

Page 6 of 8

results are not summarized above, and an isoconcentration map is not included. TPH C₁₃-C₄₀ data are available for review in **Table 2** and **Attachment B**.

The petroleum present at well C-8 appears to be gasoline only, and it is possible that turbidity is influencing samples from this well also. The chromatograms show that the TPH-DRO detections in this location are in the carbon range of C₁₀ to C₁₂, which is typical of gasoline.

Based on Chevron ETC's peer review of current and historical data from wells C-2 and C-8, Stantec recommends the following:

- Conduct an additional groundwater monitoring and sampling event during Third Quarter 2014 to test the hypothesis that sample turbidity and polar compounds are greatly influencing TPH concentrations in wells C-2 and C-8.
- During the Third Quarter 2014 groundwater monitoring and sampling event, sample wells C-2 and C-8 using a low-flow purging and sampling method. To do this, G-R will put the pump into the well and allow at least an hour to pass before purging and sampling using low-flow procedures. After the low-flow sampling is completed, G-R will purge and sample the wells with a bailer as usual. Both the low-flow and the bailer samples will be analyzed for the normal suite of analyses. This will provide a side-by-side data set for evaluating the effect of turbidity on the samples.
- Analysis for TPH C₁₃-C₄₀ will be eliminated from the sampling program due to the overlap with TPH-DRO analysis, and analysis for TPH-MO (with silica gel cleanup) will be added back into the sampling program. The TPH C₁₃-C₄₀ analysis is not providing any additional information that the TPH-DRO and TPH-MO analyses are not already providing. Silica gel cleanup is being added to the TPH-MO analysis, because polar compounds will be a problem in any extract collected at the Site due to the biodegrading petroleum source.

The additional Third Quarter 2014 groundwater monitoring and sampling event was conducted on August 29, 2014, and results will be reported to ACEH by October 28, 2014. LNAPL monitoring events will continue on a quarterly basis with results presented in semi-annual groundwater monitoring and LNAPL recovery status reports. LNAPL recovery events may be further adjusted as necessary based on future field observations.

Stantec contacted the station owner and learned that the well box for well C-4 was filled by one of their contractors. The well box was primarily filled with sand, with only a few inches of concrete at the surface. On August 1, 2014, G-R removed the concrete and sand and completed installation of a new well box for well C-4. The well integrity did not appear to be compromised. Well C-4 will be sampled during the Third Quarter 2014 groundwater monitoring and sampling event.

If you have any questions regarding this report, please feel free to contact Stantec Project Manager, Travis Flora, at (408) 356-6124 or Travis.Flora@stantec.com.

Table 2
Groundwater Monitoring Data and Analytical Results
 Chevron-branded Service Station 90504
 15900 Hesperian Boulevard
 San Lorenzo, California

EXPLANATIONS:

Groundwater monitoring data and laboratory analytical results prior to August 28, 2000, were compiled from reports prepared by Blaine Tech Services, Inc. Current groundwater monitoring data was provided by Gettler - Ryan Inc. Current laboratory analytical results were provided by Eurofins Lancaster Laboratories.

TOC = Top of Casing

(ft.) = Feet

GWE = Groundwater Elevation

(msl) = Mean sea level

DTW = Depth to Water

LNAPL = Light Non-Aqueous Phase Liquid

TPH = Total Petroleum Hydrocarbons

MO= Motor Oil

DRO = Total Petroleum Hydrocarbons as Diesel

GRO = Gasoline Range Organics

B = Benzene

T = Toluene

E = Ethylbenzene

X = Xylenes

MTBE = Methyl Tertiary-Butyl Ether

HVOCS = Halogenated Volatile Organic Compounds

($\mu\text{g/L}$) = Micrograms per liter

(ppb) = Parts per billion

(D) = Duplicate

ND = Not Detected

-- = Not Measured/Not Analyzed

QA = Quality Assurance/Trip Blank

QC = Quality Control

ESL = California Regional Water Quality Control Board - San Francisco Bay Region Environmental Screening Level for groundwater that is a current or potential source of drinking water

NE = ESL not established

† TOC elevations for wells C-2, C-3, C-7, and C-8 were inadvertently switched from September 17, 2003, to March 5, 2007.

TOC's have been corrected as of March 17, 2008, to reflect the current TOC data.

** GWE has been corrected due to the presence of LNAPL; correction factor: [(TOC - DTW) + (LNAPL Thickness x 0.80)].

¹ Depth to water measured from top of well vault.

² Detection limit raised due to foaming sample.

³ Other HVOCS were not detected at detection limits of 0.5-1.0 ppb.

⁴ Chloroform detected at <0.5 ppb.

⁵ All site monitoring wells were re-sampled due to an excessive number of foaming samples on the 09/29/94 event.

⁶ Chloroform detected at 1.8 ppb.

⁷ Laboratory report indicates uncategorized compounds are not included in gas concentration.

⁸ Chromatogram pattern indicates an unidentified hydrocarbon.

⁹ Laboratory report indicates sample diluted due to foaming.

¹⁰ MTBE value was reported from a re-analysis on 04/01/99.

¹¹ Laboratory report indicates weathered gasoline C6-C12.

Table 2
Groundwater Monitoring Data and Analytical Results
Chevron-branded Service Station 90504
15900 Hesperian Boulevard
San Lorenzo, California

EXPLANATIONS:

- ¹² BTEX and MTBE by EPA Method 8260.
- ¹³ Well redeveloped.
- ¹⁴ Analyzed with Silica gel cleanup.
acceptance limits. The hold time had expired prior to the second analysis so the original results are reported. Similar results were obtained in both trials.
- ¹⁵ Laboratory report indicates the reverse surrogate, capric acid, is present at <1%.
- ¹⁶ Laboratory report indicates TPH quantitation is based on peak area comparison of the sample pattern to that of a hydrocarbon component mix calibration in a range that includes C8 (n-octane) through C40 (n-tetracontane) normal hydrocarbons.
- ¹⁷ Laboratory report indicates target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was re-analyzed outside of the method required holding time, and the method blank results are outside the from the first trial. Similar results were obtained in both trials.
- ¹⁸ Laboratory report indicates target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was re-extracted outside of the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.
- ¹⁹ Laboratory report indicates due to the dilution of the sample extract, capric acid recovery can not be determined.
- ²⁰ Laboratory report indicates due to the matrix of the sample extract, capric acid recovery can not be determined.
- ²¹ Laboratory report indicates reporting limits were raised due to interference from the sample matrix.
- ²² Laboratory report indicates MtBE in the continuing calibration verification standard is outside the QC acceptance limits. The following corrective action was taken: This analysis was repeated using a previously opened container with headspace under a continuing calibration standard that was within the QC acceptance limits. MtBE was not detected in either analysis. Results reported are from the initial analysis.
- ²³ Laboratory report indicates due to the presence of fuel in the sample extract, capric acid recovery can not be determined.
- ²⁴ Laboratory report indicates the surrogate data is outside the QC limits due to unresolvable matrix problems evident in the sample chromatogram.
- ²⁵ BTEX by EPA Method 8260.

STANDARD OPERATING PROCEDURE - GROUNDWATER SAMPLING

Gettler-Ryan Inc. (GR) field personnel adhere to the following procedures for the collection and handling of groundwater samples prior to analysis by the analytical laboratory. All work is performed in accordance with the GR Health & Safety Plan and all client-specific programs. The scope of work and type of analysis to be performed is determined prior to commencing field work.

Prior to sampling, the presence or absence of free-phase hydrocarbons is determined using an interface probe. Product thickness, if present, is measured to the nearest 0.01 foot and is noted in the field notes. In addition, all depth to water level measurements are collected with a static water level indicator and are also recorded in the field notes, prior to purging and sampling any wells.

After water levels are collected and prior to sampling, if purging is to occur, each well is purged a minimum of three well casing volumes of water using pre-cleaned pumps (stack, peristaltic or Grundfos), or disposable bailers. Temperature, pH and electrical conductivity are measured a minimum of three times during the purging (additional parameters such as dissolved oxygen, oxidation reduction potential, turbidity may also be measured, depending on specific scope of work.). Purging continues until these parameters stabilize.

Groundwater samples are collected using disposable bailers. The water samples are transferred from the bailer into appropriate containers. Pre-preserved containers, supplied by analytical laboratories, are used. When pre-preserved containers are not available, the laboratory is instructed to preserve the sample as appropriate. Duplicate samples are collected for the laboratory to use in maintaining quality assurance/quality control standards, as directed by the scope of work. The samples are labeled to include the job number, sample identification, collection date and time, analysis, preservation (if any), and the sample collector's initials. The water samples are placed in a cooler, maintained at 4°C for transport to the laboratory. Once collected in the field, all samples are maintained under chain of custody until delivered to the laboratory.

The chain of custody document includes the job number, type of preservation, if any, analysis requested, sample identification, date and time collected, and the sample collector's name. The chain of custody is signed and dated (including time of transfer) by each person who receives or surrenders the samples, beginning with the field personnel and ending with the laboratory personnel.

A laboratory supplied trip blank accompanies each sampling set. The trip blank is analyzed for some or all of the same compounds as the groundwater samples.

As requested by Chevron Environmental Management Company, the purge water and decontamination water generated during sampling activities is transported by Clean Harbors Environmental Services to Seaport Environmental located in Redwood City, California.

Quality Control Summary

Client Name: Chevron
Reported: 07/08/14 at 04:49 PM

Group Number: 1485058

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

- A** TIC is a possible aldol-condensation product
- B** Analyte was also detected in the blank
- C** Pesticide result confirmed by GC/MS
- D** Compound quantitated on a diluted sample
- E** Concentration exceeds the calibration range of the instrument
- N** Presumptive evidence of a compound (TICs only)
- P** Concentration difference between primary and confirmation columns $>25\%$
- U** Compound was not detected
- X,Y,Z** Defined in case narrative

Inorganic Qualifiers

- B** Value is <CRDL, but \geq IDL
- E** Estimated due to interference
- M** Duplicate injection precision not met
- N** Spike sample not within control limits
- S** Method of standard additions (MSA) used for calculation
- U** Compound was not detected
- W** Post digestion spike out of control limits
- * Duplicate analysis not within control limits
- + Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.
