## **1.0 INTRODUCTION**

This report presents soil and groundwater characterization data for the property located at 2585 Nicholson Street, San Leandro, California (the Site). The data presented herein was collected in accordance with two work plans: 1) "Revised Proposed Workplan for Soil and Water Investigation" prepared by Hageman-Aguiar, Inc. dated September 20, 1995 (HA Work Plan); and 2) "Work Plan for Additional Groundwater Characterization" prepared by McLaren/Hart dated December 18, 1997 (MH Work Plan). Both work plans were approved by the Alameda County Health Care Services (ACHCS), the Site regulatory agency.

The characterization activities were performed to investigate an unauthorized release from former underground storage tanks. The objectives of the characterization activities were to: 1) collect supplemental soil data to determine current concentrations of contaminants in soil; 2) delineate the extent of contaminants in groundwater; and 3) determine the direction of groundwater flow.

### **1.1 Background**

According to the HA Work Plan, two underground storage tanks were removed from the property by Scott-Broadway in 1991. Soil and groundwater samples collected during the UST removal activities identified total petroleum hydrocarbons (TPH) as diesel and gasoline in both media.

In 1992, Hageman-Aguiar, Incorporated (Hageman-Aquiar) performed an on-site soil and groundwater investigation which included collecting soil and groundwater samples from nineteen soil borings. The activities performed during the 1992 investigation are presented in the Hageman-Aquiar document "Report of Subsurface Investigation" dated July 29, 1992. The results of the investigation identified elevated levels of petroleum hydrocarbons apparently migrating in a southerly direction. In addition to the soil and groundwater investigation, Hageman-Aquiar backfilled the Site excavation and installed one monitoring well (MW-1) on the central portion of the Site in 1992. Between 1992 and 1995, ten groundwater samples were collected from MW-1. Free floating product was present during some of the sampling events at a maximum thickness of 1.25 inches. A boring location map and tabulated analytical results from the 1992 investigation are included in Appendix A.

## **2.0 SOIL AND GROUNDWATER CHARACTERIZATION**

The soil and groundwater characterization conducted by McLaren/Hart was performed in two phases: 1) the first (initial characterization) was performed in accordance with the HA Work Plan (dated September 20, 1995); and 2) the second (supplemental characterization) was performed in accordance with the MH Work Plan (dated December 18, 1997). Soil and groundwater analytical results from the characterization activities are presented in Tables 1 and 2, respectively. Sampling locations and isoconcentration contours for benzene in groundwater are presented on Figure 2. The methodology used and results from each of the investigations are presented below.

### **2.1 Methodology**

Soil borings were advanced using a Geoprobe sampling rig. Each boring was advanced to a total depth of approximately 10 feet below ground surface (bgs). Soil samples were collected in clear acetate tubes and immediately capped. Once the total depth of boring was reached, 0.75 inch PVC slotted pipe was placed in each borehole to prevent native material from sloughing into the borehole. Groundwater was retrieved from boreholes using 0.5 inch disposable bailers. Following completion of sampling, boreholes were backfilled with neat cement. All reusable equipment was decontaminated between boreholes and samples were immediately placed on ice and shipped to the laboratory using chain-of-custody procedures. All generated wastes were stored on-site pending receipt of analytical results and were subsequently recycled.

Drilling permits were obtained from the Alameda County Flood Control and Water Conservation District (Zone 7) for the borings. An encroachment permit was obtained from the City of San Leandro for borings located on Nicholson Street. Underground Service Alert (USA) was contacted at least 48 hours prior to initiating sampling activities.

Samples were analyzed for: 1) fuel fingerprint scan by Environmental Protection Agency (EPA) Method 8015 Modified; 2) benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl-tert-butyl ether (MTBE) by EPA Method 8020. Analyses were performed by California Laboratory Services (CLS) in Rancho Cordova, California. CLS is certified by the state of California to perform the above listed analyses.

### **2.2 Initial Characterization (HA Work Plan)**

In June 1997 McLaren/Hart implemented the scope of work outlined in the HA Work Plan (dated September 20, 1995). The scope of work consisted of performing soil and groundwater sampling at eight locations (M-1 through M-8) and measuring potentiometric surface elevations from temporary well points at each location. In addition, a groundwater sample was collected from the on-site monitoring well (MW-1).

The initial boring (M-1) was continuously sampled to determine hydrogeologic conditions beneath the Site and identify sampling depths. Subsequent borings were advanced directly to sample depths.

The geology encountered beneath the Site consisted of a dark brown stiff sandy clay (CL) with saturated conditions occurring at approximately 7.0 feet bgs. Soil samples were collected from the capillary fringe (5.0 to 6.0 feet bgs) for laboratory analysis.

Upon completion of all borings and prior to backfilling activities, the top of casing of each temporary well point was surveyed to a relative benchmark. Depth to water measurements were collected for calculating the potentiometric surface elevation at each location. The results indicated significant differences in groundwater elevations and were inconclusive at providing a groundwater flow direction. It is suspected that the fine grained lithologic material and low groundwater yield encountered in the boreholes resulted in incomplete hydraulic communication within the temporary well points.

As identified in Table 1, TPH as gasoline (TPH-G) and BTEX compounds were detected in each of the on-site soil samples (M-1 through M-4), but were not detected in off-site samples from borings M-5 and M-8. Soil samples from M-6 and M-7 were not analyzed based on the soil results from M-5 and M-8. A low level of motor oil (1.5 milligrams per kilogram (mg/kg)) was detected in the soil sample from M-5. While these results indicate petroleum hydrocarbon contaminated soil exists on-site, a comparison of soil and groundwater analytical results indicates that benzene concentrations are higher in groundwater samples. Consequently, hydrocarbon contamination present in soil is likely the result of upward migration from groundwater, either through capillary or vadose migration, or temporal variations in groundwater elevations.

Groundwater analytical results (see Table 2) identified TPH-G and BTEX compounds in each of the on-site borings (M-1 through M-4), and two of the off-site borings (M-5 and M-8). The highest concentrations of petroleum hydrocarbon constituents were reported in the on-site samples. No free-floating product was encountered in monitoring well MW-1. Analytical results from borings M-6, M-7 and M-8 defined the relative extent of petroleum hydrocarbon contamination to the west and southwest. Potential lateral migration in other directions was not completely defined. Consequently, additional groundwater sampling was required to complete groundwater characterization.

### **2.3 Supplemental Characterization (MH Work Plan)**

The supplemental characterization activities consisted of collecting groundwater samples from seven additional borings (M-9 through M-15) in accordance with the MH Work Plan (dated December 18, 1997). Groundwater samples were collected and analyzed using the methodology described in Section 2.1. The objective of the supplemental characterization was to delineate off-site migration of petroleum hydrocarbon contaminants in areas undefined by the initial characterization. All samples were collected on March 18, 1998.

As shown in Table 2, diesel and motor oil were detected in groundwater samples from the supplemental borings. Low levels of diesel (0.26 to 0.27 milligrams per liter (mg/l)) were detected in the presumed upgradient borings M-10 and M-11. Motor oil was detected in all samples at concentrations ranging from 0.29 to 4.0 mg/l. Based on the fact that diesel was only detected in

borings located in the presumed upgradient groundwater flow direction, diesel appears to be associated with an off-site source. Given the widespread distribution of motor oil in groundwater, motor oil appears to be a regional issue.

Groundwater analytical results for BTEX and MTBE were below laboratory detection limits in all samples with the exception of M-9 and M-14. Analytical results from M-9, located in the presumed upgradient flow direction, revealed low levels of benzene (0.43 micrograms per liter (ug/l)) and MTBE (12 ug/l). Similarly, analytical results from M-14, located in the presumed crossgradient flow direction, also revealed low levels of benzene and MTBE (0.75 and 18 ug/l, respectively).

The benzene isoconcentration contours depicted on Figure 2 illustrate benzene results from the initial and supplemental groundwater characterization activities. The data suggests that petroleum hydrocarbons originating from the Site are migrating in a southwest direction. The presence of benzene in samples from M-5, M-8 and M-14 indicates that limited off-site migration has occurred. Given the high levels of benzene detected on-site verses the low levels of benzene detected off-site, the plume appears to be relatively stable. In addition, the lack of significant off-site migration suggests that natural attenuation is occurring beneath the Site.

The results of the characterization activities indicates that the lateral extent of petroleum hydrocarbons in groundwater is adequately defined. Additional monitoring wells will be required to confirm the groundwater flow direction and to identify the groundwater gradient.

### **3.0 CONCLUSIONS**

The results of the characterization activities have provided adequate definition of petroleum hydrocarbon contamination in soil and groundwater on and in the vicinity of the Site. While the highest concentrations of petroleum hydrocarbons were detected on-site, the low levels detected immediately off-site indicate the plume is relatively stable. In addition, the lack of significant off-site migration suggests that natural attenuation is occurring beneath the Site.

The groundwater characterization data suggests that petroleum hydrocarbons originating from the Site are migrating in a southwest direction. However, a minimum of two additional monitoring wells will be required to confirm the groundwater flow direction and identify a groundwater gradient. Bank of America NT&SA is currently evaluating options for additional activities at the Site. A work plan describing those activities will be forthcoming.

Chain Of Custody: 28543,26,03126

CLS ID No.: N8120A  
CLS Job No.: 808120

The following analyses were performed on the above referenced project:

| No. of Samples | Turnaround Time | Analysis Description           |
|----------------|-----------------|--------------------------------|
| 2              | 10 Days         | TPH Fingerprint, EPA m-8015    |
| 2              | 2 Days          | TPH as Gasoline, BTEX and MTBE |

These samples were received by CLS Labs in a chilled, intact state and accompanied by a valid chain of custody document.

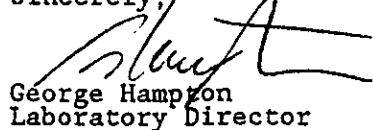

Calibrations for analytical testing have been performed in accordance to and pass the EPA's criteria for acceptability.

Modified EPA 8015 - Motor Oil:

Although Sample M-5 45364 was found to contain compounds in the retention time range generally associated with motor oil, the chromatogram for this sample was not consistent with the expected chromatographic pattern or "fingerprint." However, the reported concentration is based on motor oil calibration.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

A handwritten signature in black ink, appearing to read "George Hampton".

George Hampton  
Laboratory Director

Attention: Scott Allin

Reference: Analytical Results

Project Name: Bank of America  
Project No.: 04.0602457.001.001  
Date Received: 06/23/97  
Chain Of Custody: 28543,26,03126

CLS ID No.: N8120  
CLS Job No.: 808120

The following analyses were performed on the above referenced project:

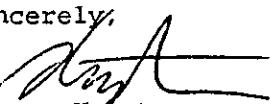

| No. of Samples | Turnaround Time | Analysis Description                     |
|----------------|-----------------|--|
| 4              | 5 Days          | Hold for subsequent analyses             |
| 13             | 5 Days          | TPH Fingerprint, EPA m-8015              |
| 13             | 5 Days          | TPH Volatiles by DHS Method M8015 (soil) |
| 13             | 5 Days          | Purgeable Aromatics by EPA 8020          |

These samples were received by CLS Labs in a chilled, intact state and accompanied by a valid chain of custody document.

Calibrations for analytical testing have been performed in accordance to and pass the EPA's criteria for acceptability.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

George Hampton

# CLS Labs

McLaren/Hart-Alameda  
1135 Atlantic Avenue  
Alameda, CA 94501

03/25/98

Attention: Scott Allin

Reference: Analytical Results

Project Name: B of A  
Project No.:  
Date Received: 03/20/98  
Chain Of Custody: 32084

CLS ID No.: P2883  
CLS Job No.: 812883

The following analyses were performed on the above referenced project:

| No. of Samples | Turnaround Time | Analysis Description           |
|----------------|-----------------|--------------------------------|
| 7              | 10 Days         | TPH as Gasoline, BTEX and MTBE |

These samples were received by CLS Labs in a chilled, intact state and accompanied by a valid chain of custody document.

Calibrations for analytical testing have been performed in accordance to and pass the EPA's criteria for acceptability.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

George Hampton  
Laboratory Director

McLaren/Hart-Alameda  
1135 Atlantic Avenue  
Alameda, CA 94501

03/31/98

Attention: Scott Allin

Reference: Analytical Results

Project Name: B of A  
Project No.:  
Date Received: 03/20/98  
Chain Of Custody: 32083

CLS ID No.: P2882  
CLS Job No.: 812882

The following analyses were performed on the above referenced project:

| No. of Samples | Turnaround Time | Analysis Description                     |
|----------------|-----------------|--|
| 7              | 10 Days         | TPH Extractables by Method M8015 (water) |

These samples were received by CLS Labs in a chilled, intact state and accompanied by a valid chain of custody document.

Calibrations for analytical testing have been performed in accordance to and pass the EPA's criteria for acceptability.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

George Hampton  
Laboratory Director
