SUBJECT: Remedial Action Summary Report for Fuel Tank Removal at
Adeline Maintenance Center

Dear Ms. Eberle:

Enclosed for your review is an Interim Remedial Action Summary Report for the fuel tank removal at the District's Adeline Maintenance Center in Oakland. The report does not include the hazardous waste disposal manifests for the tanks, nor the certificates of destruction for the soil. These documents will be sent under separate cover within one week.

If you have any question or comments on the report, please contact me at (510) 287-1629.

Sincerely,

RICHARD G. SYKES
Regulatory Compliance Officer

Subject: Interim Remedial Action Summary Report for EBMUD Facility
located at 1200 21st Street, Oakland, CA

Dear Mr. Kemp:

As requested and authorized, we have prepared the attached Interim Remedial Action Summary Report to document the remedial soil excavation activities performed at the site concurrent with removal of six underground storage tanks. The report also documents the soil sampling activities and presents the results of the analytical testing of the soil samples obtained during the excavation activities.

We have concluded that the remedial work performed to date including the removal of the various tanks combined with the soil excavation resulted in removal of the impacted soil adjacent to and beneath the former tanks which could contribute to ground water contamination. The analytical testing of soil samples obtained as the excavation proceeded indicated that the contaminated soil which could be attributed to these tanks was removed and the final samples obtained from the bottom and sidewalls of the excavation verified the limits of the excavation as related to the tanks removed.

Copies of the attached Report should be submitted to:

Alameda County Health Care Services
Department of Environmental Health
1131 Harbor Bay Parkway, 2nd Floor
Alameda, CA 94502

Regional Water Quality Control Board
San Francisco Bay Region
2101 Webster Street, Room 500
Oakland, CA 94612

It has been a pleasure to be of service to you on this project. Questions or comments regarding the attached report should be addressed to the undersigned.

Respectfully submitted,

General Environmental Management Services

Richard Camacho,

Napa, California 94558

December 29, 1994

INTERIM REMEDIAL ACTION SUMMARY REPORT
for
EAST BAY MUNICIPAL UTILITY DISTRICT
1200 21st STREET
OAKLAND, CALIFORNIA

INTRODUCTION

The project site is located at 1200 21st Street (southwest corner of the intersection of West Grand Avenue and Adeline Street) in the City of Oakland, Alameda County, California as indicated on Figure 1. The property is owned and occupied by East Bay Municipal Utility District (EBMUD).

A portion of the property (herein referred to as the "Project Site") has been used for vehicle/equipment fuel storage and distribution. The remaining portions of the site are used for offices, equipment maintenance, and equipment/materials storage. The entire facility is scheduled to be demolished and reconstructed in the next year and the site is scheduled to remain as a maintenance facility into the next century.

BACKGROUND

The project site has been used for vehicle maintenance and fuel storage/distribution for EBMUD vehicles and equipment and has consisted of several underground storage tanks, fuel dispensing pumps, vehicle work bays and office areas.

17-16
One 4,000 gallon underground gasoline storage tank and one 6,000 gallon underground gasoline storage tank (see Figure 2) were excavated and removed from the property on November 18, 1994 by CalTec Environmental, Inc. under direct observation of Alameda County Department of Environmental Health personnel. Both tanks reportedly consisted of single-wall fiberglass tanks and were reported to be less than 10-years of age (reportedly installed as replacements for previous tanks).

The gravel backfill material removed from the 6,000 gallon tank excavation exhibited minor gasoline vapors. Some of the gravel fill material was left in the excavation by the contractor. Standing water was observed in the excavation following the tank removal. ✓ This water was evacuated from the excavation (described in detail later in this report) and water did not return to the excavation. Therefore, this water has been classified as perched water confined to the tank backfill and is not classified as ground water. ✓

The gravel backfill material removed from the 4,000 gallon tank excavation exhibited strong gasoline vapors. Standing water was observed in the excavation and free petroleum product was observed seeping from the sidewalls of the excavation walls. This water and product was also evacuated from the excavation (described in detail later in this report) and water did not return to the excavation. Therefore, this water has also been classified as perched water confined to the tank backfill and is not classified as ground water.

TANK EXCAVATION AND REMOVAL

The tank removal and disposal activities are documented in a separate CALTEC Report and are only summarized herein to correlate with the remedial activities. →not so

The tank removal activities were performed by CalTec Environmental, Inc. (CALTEC) under the oversight/coordination of General Environmental Management Services (GEMS) on November 17, 1994 through November 22, 1994. Representatives from the Alameda County Health Care Services, Department of Environmental Health (ACDEH) provided the direct observation of the excavation and removal of the tanks. The tanks were transported from the property under hazardous waste manifest documentation by Erickson, Inc. (a licensed hazardous material transporter) for destruction at their treatment, storage, and disposal facility.

During the excavation of the 4,000 gallon tank a small 500 gallon concrete encased tank was encountered at the north end of the excavation (see Figure 3). The tank was believed to be a gasoline or waste oil tank and was filled with an oily fluid. The fluid was evacuated from the tank by Erickson, Inc. prior to removal.

An additional underground concrete vault containing two 350 gallon tanks was also detected (see Figure 3). These tanks were also filled with fluid (which appeared to be water). The fluid in these tanks was also evacuated by Erickson, Inc. prior to removal.

One 300 gallon tank was also encountered as the excavation proceeded (see Figure 3).

The removal of these additional tanks was also performed by CALTEC under the oversight/coordination of GEMS on November 17, 1994 through November 22, 1994. ACDEH representatives provided direct observation of the excavation and removal of the tanks. The tanks and fluids pumped from the tanks were also transported from the property under hazardous waste manifest documentation by Erickson, Inc. for destruction at their treatment, storage, and disposal facility.

TANK CONDITIONS

The 4,000 and 6,000 gallon tanks consisted of single-wall fiberglass tanks and were intact upon removal from the excavations. The 6,000 gallon tank ruptured after the tank had been removed from the excavation and prior to being loaded for transport. The tank rupture resulted in a small quantity of fluids (less than 50 gallons) to be released to the ground surface (which was contained and abated with absorbent material by CALTEC personnel).

The three concrete encased tanks consisted of unwrapped, single-wall, riveted steel tanks and were significantly corroded and pitted. Several holes were observed in the tanks at the time of removal.

↓ maybe ~ 400 gal. hard to tell

One additional 300 gallon unwrapped, single-wall, riveted steel tank was also encountered during the excavation activity. This tank was significantly corroded and pitted and several holes were observed in the tank at the time of removal.

EXCAVATION OBSERVATIONS

Based on the presence of strong gasoline vapors and the presence of petroleum products seeping from the sidewalls of the excavation for the 4,000 gallon tank, EBMUD personnel decided to proceed with limited excavation to abate the observed conditions. The soil conditions observed in the excavation for the 6,000 gallon tank did not warrant additional excavation and this area was excluded from remedial considerations. An Interim Remedial Action Work Plan was prepared by GEMS and Geo Plexus, Incorporated (dated November 19, 1994) to describe the anticipated excavation work in the vicinity of the 4,000 gallon tank area.

Excavation of the 4,000 gallon tank area was performed by CALTEC under the oversight of GEMS and Geo Plexus personnel in accordance with the Interim Remedial Action Work Plan.

The original excavation for the 4,000 gallon tank extended to a depth of 10-12 feet below the ground surface. The native soil material exposed in the sidewalls of the excavation exhibited strong petroleum odors, soil discoloration/staining (gray-green color) and free-product was observed to be leaching from these soils.

Water was observed in the excavation at a depth of 10-feet below ground surface at the time of the tank removal. Free-product was observed on the water surface in the excavation for the 4,000 gallon tank (see Figure 3). This water and product was evacuated from the excavation by Erickson, Inc. and contained in a vacuum truck for transport to Gibson Oil for recycling. The water from the 6,000 gallon tank excavation was also pumped in to the vacuum truck for transport to Gibson Oil. The transportation manifests are included in Appendix A.

Since the water did not return to the 6,000 gallon tank or the 4,000 gallon tank excavations following evacuation, and noting that ground water was not encountered in the subsequent excavation to a depth of 16-feet, the water observed in the excavations has been classified as "perched water" confined within the permeable tank backfill material and is not classified as ground water for characterization or for monitoring purposes.

REMEDIAL ACTION - SOIL EXCAVATION

Subsequent to observing the excavation conditions, additional soil was excavated around the 4,000 gallon tank and the adjacent concrete encased tanks to facilitate the removal of the additional tanks and to further abate the observed impacted soil.

As previously stated, the native soil around the 6,000 gallon tank did not exhibit staining or strong gasoline vapors and the area was not over-excavated.

The excavation for the 4,000 gallon and adjacent concrete encased tanks (hereafter referred to as the "excavation") was extended laterally to the north, east and south to abate any impacted soil which was attributed to the tanks. The excavation was extended vertically to a depth of 13- to 16-feet below ground surface. Figure 4 illustrates the extent and configuration of the final excavation.

Soil samples were obtained as the excavation proceeded to determine the limits of the contaminated soils, to document and classify the soil materials, and to characterize the soil for disposal purposes. Figure 5 illustrates the locations of the soil samples obtained throughout the excavation process. The analytical testing (see Appendix B) is described later in this report.

The excavated soil consisted of brown to greenish-gray, fine-grained to silty sand, gray-brown silty clay, fibrous peat, and blue-green silty sand. Figures 6 and 7 illustrate cross-sections of the excavation and identifies the general soil materials encountered.

Water seepage (perched water) was observed from various locations along the side walls of the excavation and along the sand bedding for the various utility lines (storm sewer, sanitary sewer, water, phone lines, etc.) encountered within the limits of the excavation. The water observed in these shallow areas is not classified as ground water for characterization or for monitoring purposes.

The excavation activities were terminated upon reaching the vertical extent of the impacted soil based on observations and as verified by analytical testing of the soil samples. The soil exposed at the base of the excavation consisted of a dry, blue-gray, dense, silty sand which did not exhibit any evidence of petroleum contamination. The lateral limits of the excavation (see Figure 4) were also determined in-part by the property limits along West Grand Avenue, encroachment on the adjacent structure, encroachment on water mains, and through professional judgment of the site conditions. Based on observation of the base of the excavation and the excavation sidewalls, and confirmed by analytical testing, the soil contamination which was attributed to the underground tanks was excavated.

Residual, near surface soil contamination remains in place at depths of 1-foot to 8-feet below the ground surface around the perimeter of the excavation, particularly beneath West Grand Avenue and beneath the existing service building. Based on the location, extent and depth of this shallow soil contamination, this contamination did not appear to be related to the former underground tanks. The lateral extent of this shallow soil contamination has not been identified and investigation, characterization, or abatement of these near surface soils was not within the scope of the interim remedial action.

EXCAVATED SOIL DISPOSAL

The soil material generated during the initial remedial excavation activities (soil which exhibited free petroleum product and very strong gasoline vapors) was excavated and loaded directly onto trucks for transport for thermal treatment and recycling at Remedial Environmental Marketing Company, Inc. (REMCO) located in Richmond, California. Characterization samples beyond the initial tank removal samples were not obtained for this material. All transportation was performed under manifest conditions. Appendix C includes the transportation manifest for soil transported for recycling at REMCO. 1,391 tons

Following removal of the visibly fuel contaminated soil, additional excavated soil was characterized (see Appendix B) and was determined to be non-hazardous. This soil was transported for disposal at Browning-Ferris, Inc. (BFI) Vasco Road Landfill located in Livermore, California. Appendix D includes the transportation manifest for the soil transported for disposal at BFI Vasco Road. 90 yd³

INITIAL TANK REMOVAL SOIL SAMPLING

As directed by the ACDEH personnel, soil samples of the native soil materials were obtained from the sidewalls of the excavation for the 6,000 gallon tank (a tie-down slab prevented collection of samples immediately beneath the tank); beneath the 4,000 gallon tank; and beneath the three concrete encased tanks. Excavation sidewall samples were also obtained from the initial excavation for the 4,000 gallon tank and the immediately adjacent concrete encased tank.

The soil samples were obtained from the excavations through the use of an excavator bucket. Figure 5 illustrates the sample locations within the excavation and Figures 6 and 7 (cross-sections) illustrate the vertical distribution of these samples.

The soil samples collected for analytical testing were obtained from the excavator bucket by advancing a pre-cleaned 2 inch I.D. brass liner into the undisturbed soil contained in the backhoe bucket. The soil samples were immediately sealed in the liner using aluminum foil and plastic caps and properly labeled including: the date, time, sample location, and project number.

The samples were placed immediately into a chilled cooler and maintained at 4⁰ C for transport to the laboratory under chain-of-custody documentation. The analytical test data is presented in Appendix B.

EXCAVATION WATER SAMPLING

As previously stated, water was observed in the excavation for the 6,000 gallon tank and water and petroleum product was observed in the initial excavation for the 4,000 gallon tank. Also as previously stated, this water and product was evacuated from the excavations and water did not return to the excavations (the transportation manifests are included in Appendix A). As such the observed water is not reported as ground water for characterization or monitoring purposes. * 13,064 gal

Following collection of the soil samples, ACDEH personnel directed that a "grab" water sample be obtained from the 6,000 gallon excavation. The water sample was obtained through the use of a sterile disposable teflon bailer which was lowered into the water column to collect a representative water sample.

The water contained in the bailer was then decanted directly into sterile vials/bottles with Teflon lined screw caps. The samples were immediately sealed in the vials/bottles and properly labeled including: the date, time, sample location, project number, and indication of any preservatives added to the sample. The samples were placed immediately into a chilled cooler and maintained at 4⁰ C for transport to the laboratory under chain-of-custody documentation. The analytical test data is presented in Appendix B.

REMEDIAL ACTION VERIFICATION ANALYTICAL TESTING

Soil samples were obtained from the perimeter walls and the base of the excavation during and following completion of the remedial excavation activities. The soil sampling was performed consistent with the procedures previously described. Figure 5 illustrates the locations of the soil samples.

The soil material exposed at the base of the excavation and the lower 2- to 4-feet of the excavation sidewalls consisted of a dry, blue-gray, dense, silty sand which did not exhibit any evidence of petroleum contamination.

ANALYTICAL TESTING

The soil and water samples were submitted to and tested by McCampbell Analytical, Inc., a State of California, Department of Health Services certified testing laboratory. Analytical testing was scheduled and performed in accordance with the State of California, Regional Water Quality Control Board Recommendations for Initial Evaluation and Investigation of Underground Tanks (RWQCB, 1988) and Alameda County Department of Environmental Health guidelines.

The soil samples were tested for various properties for characterization and for disposal purposes as indicated on the Chain-of-Custody Forms. The analytical testing included:

- Total Petroleum Hydrocarbons as gasoline by Method GCFID 5030/8015
- Total Petroleum Hydrocarbons as diesel by Method GCFID 3550/8015
- Oil & Grease by EPA Method 5520
- Volatile Aromatics (BTXE) by EPA Method 8020
- Volatile Organic Compounds by EPA Method 8240
- Semivolatile Compounds by EPA Method 8270
- LUFT Metals and CAM 17 Metals by EPA Methods 6000/7000
- Reactivity, Corrosion, and Ignitability

The analytical test data for the soil samples, along with the Chain-of-Custody Forms are presented in Appendix B.

The grab water samples from the excavation for the 6,000 gallon tank were tested for:

- Total Petroleum Hydrocarbons as gasoline by Method GCFID 5030/8015
- Total Petroleum Hydrocarbons as diesel by Method GCFID 3550/8015
- Volatile Aromatics (BTXE) by EPA Method 8020.

The analytical test data for the water samples, along with the Chain-of-Custody Forms are also presented in Appendix B.

FINDINGS

6,000 Gallon Tank

This tank area was not included in the remedial excavation activities.

The analytical testing detected low concentrations (6.1 to 24 ppm) of Total Petroleum Hydrocarbons as gasoline; non-detect to low concentrations (24 ppm) of Total Petroleum Hydrocarbons as diesel; non-detectable concentrations of Oil & Grease; and low concentrations of Volatile Aromatic Compounds (Benzene, Toluene, Ethyl Benzene, and Xylene) in the soil samples obtained from the sidewalls of the tank excavation (perimeter of tie-down slab prevented samples from beneath the tank).

4,000 Gallon Tank

The analytical testing detected low concentrations (6.8 to 8.0 ppm) of Total Petroleum Hydrocarbons as gasoline; non-detectable levels of Total Petroleum Hydrocarbons as diesel; non-detectable concentrations of Oil & Grease; and low concentrations of Volatile Aromatic Compounds (Benzene, Toluene, Ethyl Benzene, and Xylene) in the soil samples obtained beneath the tank.

500 Gallon Encased Tank Adjacent To The 4,000 Gallon Tank

The analytical testing detected low to high concentrations (12 to 900 ppm) of Total Petroleum Hydrocarbons as gasoline; non-detect to low concentrations (440 ppm) of Total Petroleum Hydrocarbons as diesel; low concentrations (220 ppm) of Oil & Grease; and low concentrations of Volatile Aromatic Compounds (Benzene, Toluene, Ethyl Benzene, and Xylene) in the soil samples obtained beneath the tank.

Two 350 Gallon Concrete Encased Tanks

The analytical testing detected moderate concentrations (280 to 580 ppm) of Total Petroleum Hydrocarbons as gasoline; low concentrations (29 to 110) of Total Petroleum Hydrocarbons as diesel; and moderate to high concentrations of Volatile Aromatic Compounds (Benzene, Toluene, Ethyl Benzene, and Xylene) in the soil samples obtained beneath these tanks.

300 Gallon Tank

This tank was encountered during the excavation activities and soil samples were not obtained directly beneath the tank.

Tables 1 and 2 summarize the analytical testing results for the soil samples for petroleum related products for the initial tank removal samples.

Upon completion of the excavation activities, additional soil samples were obtained from the bottom of the excavation to verify the limits of the excavation. The samples were obtained as previously described and the analytical testing was performed by McCampbell Analytical as previously described. The analytical test data is also included in Appendix B.

Concentrations of Total Petroleum Hydrocarbons as gasoline ranged from non-detectable to 11 ppm. Total Petroleum Hydrocarbons as diesel and Oil & Grease compounds were not detected in the soil samples. Non-detectable to low concentrations of Volatile Aromatic Compounds (Benzene, Toluene, Ethyl Benzene, and Xylene) were detected in the final soil samples obtained from the perimeter of the excavated area. Tables 5 and 6 summarizes the results of the analytical test data for these samples.

Surficial Soil Contamination Not Attributed To Tanks

Low to high concentrations of Total Petroleum Hydrocarbons as gasoline; low to moderate concentrations of Total Petroleum Hydrocarbons as diesel; low concentrations of Oil & Grease; and low to moderate concentrations of Volatile Aromatic Compounds were also detected in the near surface soil samples obtained from the perimeter of the excavated area (principally in the upper 8-feet of soil). Volatile Organic Compounds were not detected in the samples analyzed. Tables 7 and 8 summarize the analytical test data for these samples:

As indicated by the analytical test data in Tables 7 and 8 (also see Appendix B and Figures 5, 6, and 7), the highest concentrations of petroleum compounds remaining in the perimeter walls of the excavation were located along West Grand Avenue at depths of 4-8 feet and in front of the service bay portion of the adjacent structure. The vertical location of the shallow soil contamination with respect to the location and depth of the former tanks suggest that this soil contamination is not directly associated with the former tanks.

EXCAVATION BACKFILLING

Following collection of the final soil samples from the base and perimeter walls, the excavations were backfilled to the ground surface with clean import fill material (sand and gravel).

CONCLUSIONS

We have concluded that the remedial work performed to date including the removal of the various tanks and excavation of the soil adjacent to and beneath the tanks has resulted in removal of the impacted soil adjacent to and beneath the former underground storage tanks which could be directly attributed to the former tanks. ✓

The soil sampling which occurred as the excavations proceeded indicated that the contaminated soil which was directly attributed to the former tanks was removed and the final samples obtained from the bottom and sidewalls of the excavation verified the limits of the excavation as related to the tanks removed. ✓

It is our opinion that the water initially observed in the excavations for the 4,000 gallon and 6,000 gallon tanks was perched water confined to the permeable tank fill material and is not ground water for characterization/site assessment purposes. The analytical test data for the water sample from the 6,000 gallon tank excavation is interpreted to be representative of that perched water which was subsequently pumped from the excavation by Erickson. Similarly, the water and petroleum product observed in the excavation for the 4,000 gallon tank was pumped from the excavation by Erickson. Water did not return to these excavations following pumping. As such, it is also our opinion that ground water was not encountered during the excavation.

Shallow soil contamination remains in-place at the site and beneath West Grand Avenue at depths ranging from 1-foot to 8-feet below the ground surface. Analytical testing of this zone of soil identified detectable concentrations of Total Petroleum Hydrocarbons as gasoline, Total Petroleum Hydrocarbons as diesel, Total Petroleum Hydrocarbons as Oil & Grease, and Volatile Aromatic Compounds. The analytical testing indicates that the highest concentrations of petroleum compounds (TPHgas ranging from 1,400 to 2,800 ppm) remaining in the perimeter walls of the excavation were located along West Grand Avenue at depths of 4-8 feet and in front of the service bay portion of the adjacent structure.

The source(s) of this residual soil contamination and the lateral extent of the soil contaminant plume have not been determined. The petroleum products remaining in the shallow soils appear to be confined to this upper section of soil and appear to have migrated along existing utility trenches, along fill/native soil interfaces, through the porous fill and peat soil materials, and through the fractures in the underlying silty clay.

It is our opinion that the residual near-surface soil contamination which exists beneath West Grand Avenue and the project site is not related to the former underground storage tanks.

Based on information provided by EBMUD personnel, the project site is scheduled to be redeveloped in the upcoming year. The development plans indicate that the demolition of the existing structures will result in large excavations associated with removal of building foundations, utility removal and re-alignment, and removal of additional subsurface structures (sumps, vaults, etc.). These excavations will result in extensive exposures of the near surface soils, particularly in the areas of known surface and near surface soil contamination.

Based on the information derived from this interim remedial action, it is anticipated that additional contaminated near-surface soil will be encountered during the site demolition and that additional contaminated soil will likely be excavated (and remediated/disposed of) at that time.

RECOMMENDATIONS

It is recommended that consideration of any subsurface borings advanced for further site characterization and installation of any monitoring wells for ground water characterization be postponed until the ensuing demolition excavations are accomplished and observed by a Registered Civil/Geotechnical Engineer and/or Certified Engineering Geologist. It is also recommended that these excavations be documented (observed, logged, and sampled) and that the findings of these observations be incorporated into additional site characterization investigation which may be performed.

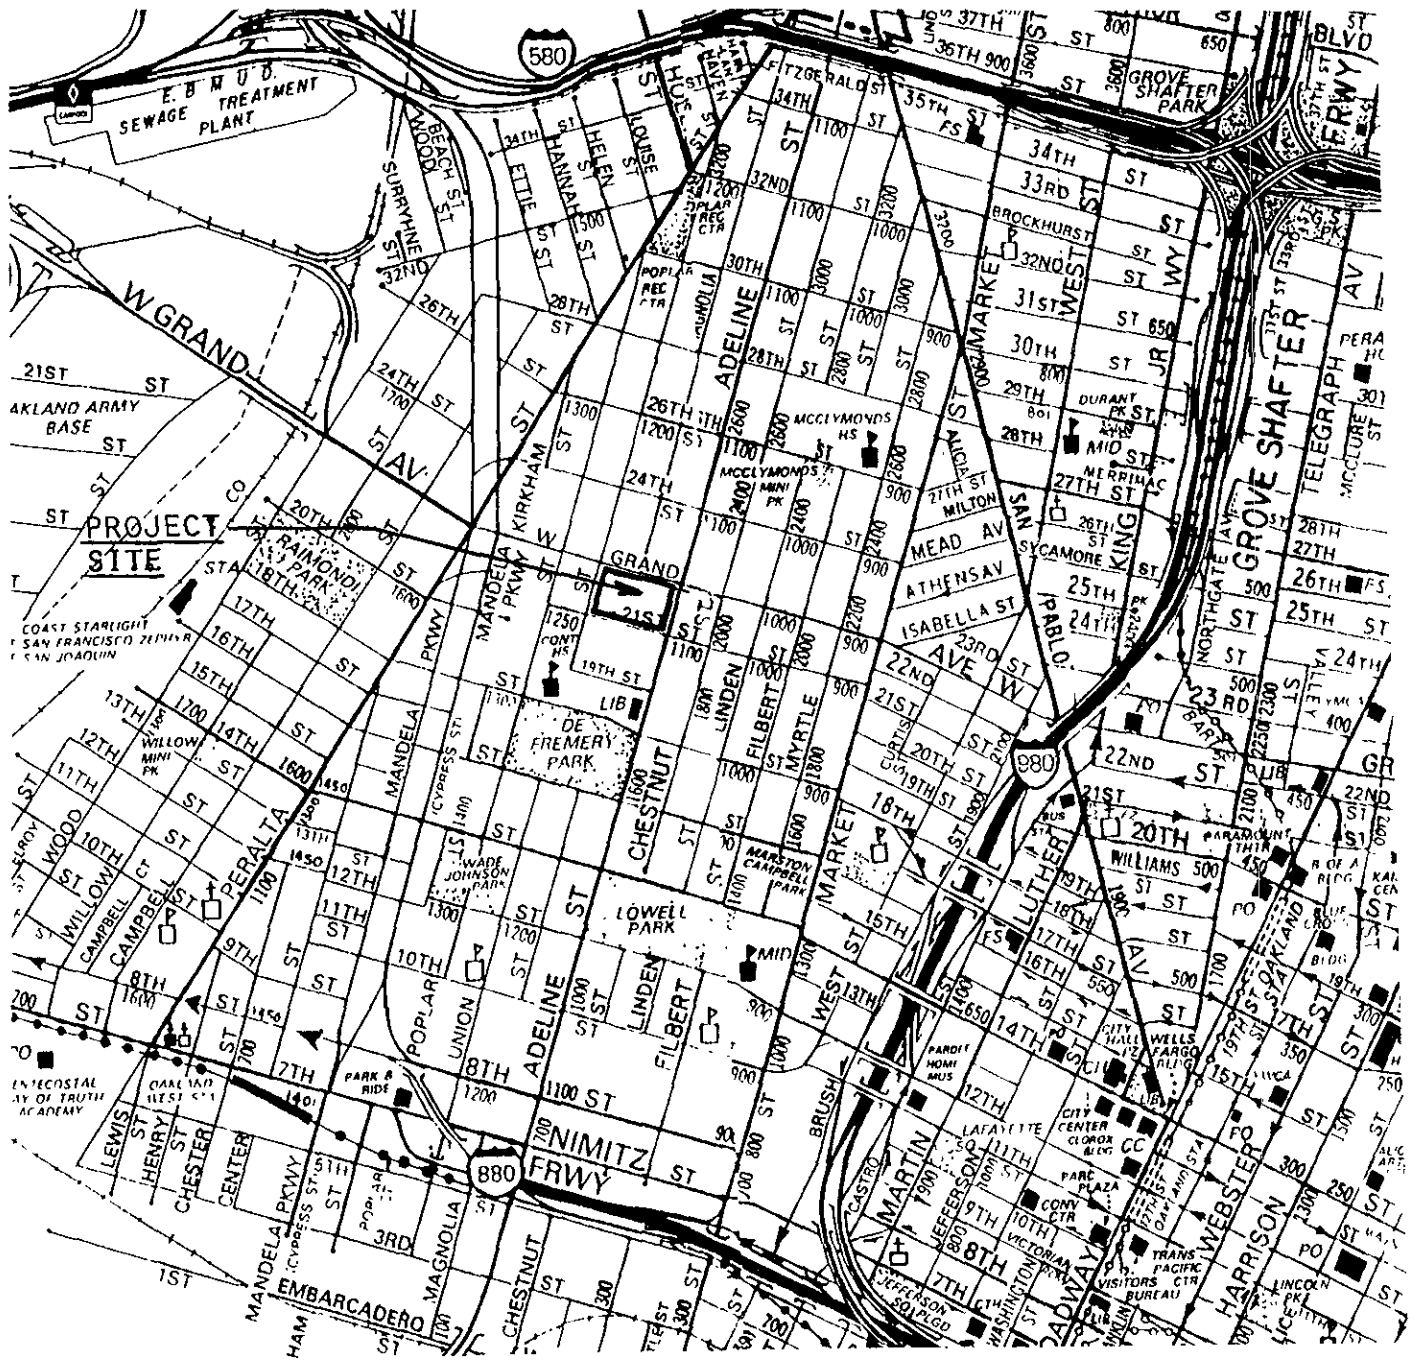

It is also recommended that Alameda County Department of Health Services suspend any requirements for further characterization and/or ground water monitoring and that actual requirements for these items (if required) be re-assessed based on the findings of the subsequent excavation activities.

CLOSURE

It has been a pleasure to be of service to you on this project. Should you have questions regarding information presented in the attached report please contact us.

Respectfully submitted,

General Environmental Management Services

RCI (Reactivity, Corrosivity & Ignitability)

CA Title 22, Section 66261.21-66261.23

Lab ID	Client ID	Matrix	Reactivity ⁺	Corrosivity (pH)	Ignitability ^o
42542	MK120	S	negative	6.94	negative

⁺ negative means no obvious reaction with water, no evolution of gas upon contact with water, appears to contain no reactive cyanide or sulfide (< ~ 5 mg/kg by EPA SW-846, chapter 7, modified), and shows no indication of explosivity.

^o negative for a soil means the absence of spontaneous combustion and the absence of flammability upon exposure to a naked flame.

[#] cluttered chromatogram; surrogate and sample peaks co-elute or surrogate peak is on elevated baseline

⁺ The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation: a) unmodified or weakly modified diesel is significant; b) diesel range compounds are significant; no recognizable pattern; c) modified diesel?; light(CL) or heavy(CH) diesel compounds are significant; d) gasoline range compounds are significant; e) medium boiling point pattern that does not match diesel(kerosine-range compounds); f) one to a few isolated peaks present; g) oil range compounds are significant; h) lighter than water immiscible phase is present.

[#] cluttered chromatogram; sample peak co-elutes with surrogate peak

⁺ The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation: a) unmodified or weakly modified gasoline is significant; b) heavier gasoline range compounds are significant(aged gasoline?); c) lighter gasoline range compounds (the most mobile fraction) are significant; d) gasoline range compounds are significant; no recognizable pattern; e) TPH pattern that does not appear to be derived from gasoline (?); f) one to a few isolated peaks present; g) strongly aged gasoline or diesel range compounds are significant; h) lighter than water immiscible phase is present.
