**Re: Soil Investigation for Site Closure Report  
ARCO Service Station #6148  
5131 Shattuck Avenue  
Oakland, California**

Dear Mr. Hwang:

At the request of Atlantic Richfield Company (RM) - a BP affiliated company, URS Corporation (URS) is pleased to submit results from this Soil Investigation (SI) at Atlantic Richfield Company Service Station #6148 located at 5131 Shattuck Avenue in Oakland, California (Site). URS and RM submitted a Work Plan for Soil Investigation for Site Closure on November 18, 2003 in response to a directive letter from the Alameda County Health Care Services Agency (ACHCSA), dated October 20, 2003 (Attachment A). The field work was completed on April 29, 2004.

As requested in the ACHCSA letter dated October 20, 2003, the soil confirmation results, the fourth quarter 2003 groundwater sampling data, and the first quarter 2004 groundwater sampling data are presented in this Soil Investigation Report. The SI results and historical Site groundwater and soil data confirm insignificant hydrocarbon impactation at the Site, therefore URS and RM request Site closure.

## 1.0 BACKGROUND

The Site is an active ARCO retail service station located at the southwestern corner of the intersection of 52<sup>nd</sup> Street and Shattuck Avenue in Oakland, California (Figure 1). The current underground storage tank (UST) complex consists of one 12,000-gallon UST and one 20,000 UST. Product lines and dispensers were replaced in November 2000. Groundwater monitoring and sampling at the Site was initiated in December 1991.

### 1.1 Geology and Groundwater

The Site is located west of the East Bay Hills and lies within the Berkeley Alluvial Plain, which is a sub-area of the East Bay Alluvial Plain. Soil encountered beneath the Site consists of primarily silty clay to clayey sand and sandy gravel. Groundwater is measured at a depth ranging from 12 to 18 feet below ground surface (bgs) with seasonal fluctuations of 2 to 3 feet (Table 1). Historical groundwater

data indicates groundwater flows generally south-southwest. The soil immediately at the water table ranges from silty sands to sandy gravels (Attachment B). Above the water table the thickness of the sand and gravel based units are limited to approximately 4 feet. A unit comprising of lower permeability sediments ranging from silty clay to sandy silt overlies the aquifer sediments to near surface grade (Attachment B).

## 1.2 Previous Remediation Activities

On June 1, 1987, Crosby and Oberton, and Erico Construction removed a waste-oil tank from the Site (Figure 2). During tank removal, one soil sample was collected from the bottom of the waste-oil tank pit for characterization. Results indicated petroleum impacted soil was encountered in the tank pit so the pit was over excavated and the soil was disposed at a landfill.

In December 1991, Rehabilitation Engineering and Assistive Technology Society of North America (RESNA) conducted the first phase of subsurface environmental investigation related to the former waste-oil tank. The investigation included drilling four on-site soil borings, B-1 through B-4, in the immediate vicinity of the tank pit, and subsequently converting three of the borings to groundwater monitoring wells MW-1, MW-2, and MW-3 (Figure 2). Results of the investigation indicated the presence of petroleum hydrocarbons in subsurface soil and groundwater beneath the Site (Table 2).

In October 1992, RESNA conducted the second phase of investigation to further assess the extent of petroleum hydrocarbons in the subsurface soils and groundwater beneath the Site. The investigation included drilling four on-site soil borings, B-5 through B-8, and converting the borings to groundwater monitoring wells, MW-4 through MW-7 (Figure 2). Results of the soil samples are included in Table 2.

In April 1993, RESNA conducted the third phase of investigation to further assess the extent of petroleum hydrocarbons in the subsurface soils and groundwater beneath the Site and install remediation wells for pilot testing. The investigation included drilling eleven test borings, TB-1 through TB-11, and installing an air sparge (AS) well, AS-1, in test boring TB-6 (Figure 2). Results of the soil samples are included in Table 2.

RESNA concluded from the three phases of investigation that petroleum hydrocarbons in the subsurface soil were limited to three general areas:

1. Immediate vicinity of the operating service station islands,
2. Along the northern and south-southwestern edges of the former USTs,
3. Immediate vicinity of MW-1, MW-2 and MW-3 in the southern section of the Site.

Additionally, RESNA concluded the contamination is limited to the capillary-fringe zone and petroleum hydrocarbon impact to groundwater was greatest in the south-southwestern portion of the Site (Figure 3).

In July 1993, RESNA drilled three soil borings, B-9, B-10 and B-11, and installed one combination AS/vapor extraction well, AS-2/VW-2, and two vapor extraction wells, VW-1 and VW-3, in the borings. All three wells were installed in the southern portion of the Site in the vicinity of the former waste-oil tank (Figure 3).

In June 1995, EMCON submitted a remedial action plan (RAP) to the Regional Water Quality Control Board (RWQCB) and ACHCSA. The RAP detailed the results of the SVE and AS pilot test conducted by RESNA in February 1995, and proposed an integrated in situ soil and groundwater treatment approach that included: 1) an SVE system for treating petroleum hydrocarbon impacted vadose-zone

and capillary-fringe soils and 2) AS and air-bubbling system for treating petroleum hydrocarbons in saturated soils and groundwater.

On August 14, 1995, ARCO commenced construction activities for the installation of the remediation system. On August 15, 1995, during excavation of a trench approximately 4 feet south of the southern pump island, Balch Petroleum, Inc. (Balch), damaged a gasoline product line at approximately 26 inches below grade. Less than 4 ounces of gasoline leaked from the product line before it was fixed (EMCON 1995). The remediation system was started during September 1995.

In February 1996, EMCON submitted a remedial well installation report for the destruction of one combination AS/SVE well and the installation of eight SVE wells and four AS wells.

The SVE/AS system was used at the Site from September 1995 through February 2000. Approximately 1,894 pounds of total petroleum hydrocarbons as gasoline (TPH-g) and 0.0131 pounds of benzene were removed from the Site using the remediation system.

Beginning in November 2000, the USTs, product lines and dispensers were removed and replaced. The work was completed in January 2001. The current UST complex consists of one 12,000-gallon UST and one 20,000 UST. 552.42 tons (370 cubic yards) were excavated and removed from areas surrounding the product lines, dispensers and USTs in 2000 (Figure 2).

## **2.0 SOIL INVESTIGATION**

The purpose of the SI was to collect confirmation soil samples as requested in the ACHCSA letter dated October 20, 2003 (Attachment A) to evaluate the effectiveness of Site work and investigate the vertical extent of soil contamination near soil borings VW-6 and DP-5. A Work Plan for Soil Investigation for Site Closure was submitted on November 18, 2003 and field work was completed on April 29, 2004.

To evaluate the effectiveness of Site work, which includes remediation by the SVE/AS system, URS advanced 8 soil borings and collected fifteen soil confirmation samples in the immediate vicinity of historical soil borings (B-1, B-2, B-3, B-6, TB-4, TB-7, T1-N, T1-C, VW-6, DP-2, and DP-5) that exceeded the July 2003 California RWQCB Environmental Screening Levels (ESLs) for total petroleum hydrocarbons as gasoline (TPH-g) (100 mg/kg). Unless specified otherwise, the term ESLs in this report is in reference to environmental screening levels established for deep soils (>3m) where groundwater is a current or potential source of drinking water (Attachment C). Historical soil analytical results are summarized on Table 2. Previous boring locations and the confirmation boring locations that were completed are illustrated in Figure 3. The sampling locations and rationale are outlined in Table 3. As a safety precaution, soil confirmation samples were not taken in areas within 4 feet of product/vapor lines or dispensers, and EBM authorization granted for CSB-5, which was within 10 feet of the UST concrete pad.

### **2.1 Preliminary Field Activities**

Before initiating field activities, URS obtained the necessary permits, prepared a Health and Safety Plan (HASP) for the proposed work, cleared the Site for subsurface utilities, and completed the URS borehole checklist. The utility clearance included notifying Underground Service Alert (USA) of the pending work a minimum of 48 hours before initiating the field investigation, securing the services of Cruz Brothers locating company, and obtaining Site plans from the 2000 UST and product line upgrade to confirm the absence of underground utilities at each boring location. As a result, borings CSB-5, CSB-6, CSB-8, CSB-9 were relocated from the locations suggested in the Work Plan (Figure 1). CSB-

4 was moved approximately 35 feet cross-gradient due to inaccessibility of the remediation enclosure area with a drill rig. CSB-7 was not advanced due to the presence of electrical and product lines and an anomalously thick concrete pad of greater than 24 inches. CSB-9 was advanced cross gradient of CSB-7 and adequately represents local Site conditions.

A site-specific HASP addressing the soil boring activities was prepared for personnel implementing the Work Plan. A copy of the HASP was available on-site at all times. A safety tailgate meeting was conducted with subcontractors and URS employees on-site to review the Site hazards and drilling work scope.

## 2.2 Soil Boring Sampling and Results

Eight soil borings were advanced to approximately 2 to 30 feet below ground surface (bgs) under the supervision of a URS field geologist using Air-knife and Geoprobe® rigs (Figure 3). URS health and safety protocol for utility clearance requires the boring locations be air-knifed or hand augured to 5 feet bgs. The Geoprobe® rig was used to log the borings and collect soil samples. Soils were classified by a URS field geologist according to the Unified Soil Classification System (USCS) and examined using visual and manual methods for parameters including odor, staining, color, grain size, and moisture content. Soil samples for analysis were collected as described on Table 3.

Each soil sample collected for possible chemical analysis was covered at each end with Teflon™ sheeting, capped with plastic end caps, labeled, and placed in an ice-filled cooler for preservation. The soil sample taken at 2 feet bgs (CSB-8-2) was collected from hand auger cuttings, and placed in a brass tube sealed at both ends with Teflon™ sheeting and plastic caps. The samples were then transported under chain-of-custody protocol to Severn Trent Laboratories (STL), a California State-certified analytical laboratory. Soil samples were analyzed by EPA Method 8260B for the following:

- GRO and BTEX compounds
- MTBE and other fuel oxygenates
- Volatile Organic Compounds

Results from the 15 soil samples collected at this Site are summarized in Tables 4 and 5 with complete analytical results in Attachment D. GRO were detected above the laboratory reporting limit in eight samples at concentrations ranging from 1.0 milligram per kilogram (mg/kg) (CSB-5-18.0) to 750 mg/kg (CSB-3-17.5). All detections for GRO were in samples collected from 16 to 26 feet bgs. Benzene was detected above the laboratory reporting limit in one sample (CSB-6-16.0) at a concentration of 0.007 mg/kg. Toluene was detected above the laboratory reporting limit in two samples at concentrations of 0.0056 mg/kg (CSB-6-16.0) and 0.74 mg/kg (CSB-2-18.0). Ethyl-benzene was detected above the laboratory reporting limit in three samples at concentrations ranging from 0.25 mg/kg (CSB-6-16.0) to 13 mg/kg (CSB-2-18.0). Xylenes were detected above the laboratory reporting limit in two samples at concentrations of 0.0099 mg/kg (CSB-6-16.0) and 100 mg/kg (CSB-2-18.0). MTBE was not detected above the laboratory reporting limit in any of the samples. Samples were also analyzed for the fuel oxygenates Di-isopropyl ether, Ethyl tert-butyl ether, tert-Amyl methyl ether, and tert-Butyl alcohol (TBA). Only TBA was detected in two samples above laboratory reporting limits at concentrations of 0.012 mg/kg (CSB-9-11.5) and 0.014 mg/kg (CSB-8-2).

## **2.3 Waste Disposal**

Investigation-derived waste soil and water were temporarily stored on-site in 55-gallon, Department of Transportation-approved 17H drums and characterized for proper waste disposal. The waste was disposed of in accordance with applicable regulations based on soil characterization results at a California regulated facility.

## **2.4 Site Characterization of Soils**

For the purpose evaluating the effectiveness of remediation at the Site, Table 6 compares this SI analytical data to relevant historical soil analytical data based on location. Soil analytical data from all previous soil sampling events in 1991, 1992, 1993, 1995, and 2000 are also included in Table 2.

In order to understand the Site's current environmental risks, Table 6 also includes the 2003 RWQCB Environmental Screening Levels (ESLs) for deep soils (>3 m) where groundwater is a current or potential source of drinking water (Attachment C). It is important to consider that the presence of constituents of concern (COC) at concentrations in excess of an ESL does not necessarily indicate that adverse impacts to human health or the environment are occurring.

Four samples (CSB-1-17.5, CSB-2-18.0, CSB-3-17.5, and CSB-9-16.5) within 16.5-18.0 feet bgs had GRO concentrations above the ESL reporting limit of 100mg/kg. One sample (CSB-2-18.0) also had a xylene concentration that exceeded the ESL reporting limit of 1.5 mg/kg. No other COC were detected above ESLs. It is also clear that the extent of petroleum hydrocarbons that exceed ESLs is limited to two discrete locations.

Samples CSB-1-17.5, CSB-2-18.0, and CSB-3-17.5 are all clustered downgradient of the former waste oil tank at the southwest corner of the Site (Figure 3). While the soil analytical results range from 750 mg/kg to 590 mg/kg in at these three locations, quarterly groundwater monitoring data from the corresponding wells MW-1, MW-2, and MW-3 has yielded concentrations below the ESL for GRO since at least first quarter of 2003 at MW-1 and MW-2 and since the second quarter of 2003 at MW-3 (Table 1). The groundwater data provides evidence that the local contaminant plume in the soil is stable and not leaching into the groundwater.

The other location where GRO were detected above the ESL is on the east side of the dispensing island closest to the station building. The sample (CSB-9-16.5) was taken approximately 15 feet cross gradient from a sample (TB-7) taken in November 2000 during the UST/product line upgrade. The GRO concentration has apparently attenuated from 610 mg/kg (TB-7) to 170 mg/kg (CSB-9-16.5), or the contaminant plume is laterally constrained and is not moving crossgradient. All samples taken at other depths at CSB-9 yielded concentrations below the ESLs for GRO, BTEX, and MTBE. This provides evidence that the contaminant plume is also vertically confined. In addition to this, 552.42 tons (370 cubic yards) were excavated and removed from areas surrounding the product lines, dispensers and USTs in 2000 (Figure 2).

In addition to the residual COC's in soil impact on groundwater, direct exposure to human receptors from Site soils was considered. Human receptors that may potentially come in direct contact with soils include construction/trench workers. A comparison of ESLs protective of construction workers was used to evaluate potential health risk to direct exposure from soil. ESLs from Table K-3, *Direct Exposure Screening Levels Construction/Trench Worker Exposure*, in Volume 2 of the ESL document (RWQCB 2003) were compared with concentrations in Site soil (Attachment C). There were no exceedances of the selected direct exposure ESL.

### **3.0 Recommendations**

The results of the SI at Site 6148 confirm two very localized areas of hydrocarbon impacted soil located near the former waste oil tank and near the east end of the dispenser island closest to the station building. Leaching of residual hydrocarbons from soils into the groundwater is minimal based on concentrations of GRO in the soil (CSB-1-17.5, CSB-2-18.0, and CSB-3-17.5) and the groundwater analytical data from proximal monitoring wells (MW-1, MW-2, and MW-3) (Table 4 and Table 1, respectively). Soil at the Site has been fully characterized from the prior through the most recent sampling events, therefore no further sampling of soil is recommended at the Site.

Recommendations for Site 6148 include continued quarterly groundwater monitoring at wells MW-1, MW-2, MW-3, and MW-5 through 2004. URS also recommends annual groundwater monitoring at monitoring wells MW-4, MW-6, and MW-7. In the absence of detections above ESLs in groundwater for GRO, BTEX, or MTBE compounds, we are recommending closure at the end of 2004.

This report is based on data, Site conditions, and other information that are generally applicable as of the date of the report, and the conclusions and recommendations herein are therefore applicable only to that time frame. Background information, including but not limited to previous field measurements, analytical results, Site plans, and other data has been furnished to URS by RM, its previous consultants, and/or third parties that URS has used in preparing this report. URS has relied on this information as furnished. URS is not responsible for nor has it confirmed the accuracy of this information. The analytical data provided by the laboratory approved by RM have been reviewed and verified by that laboratory. URS has not performed an independent review of the data and is neither responsible for nor has confirmed the accuracy of these data.

We appreciate the opportunity to submit this Soil Investigation for Site Closure to ACHCSA and trust that this document meets with your approval. Please notify us of your approval as soon as practicable. If you have any questions or concerns, feel free to contact me at (510) 874-3280.

Sincerely,

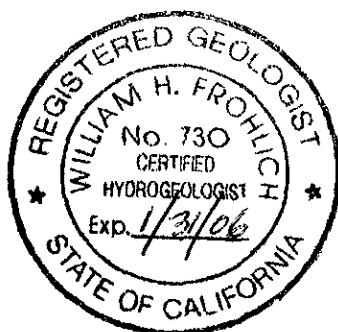

**URS CORPORATION**

**Table 1**  
**Groundwater Elevation and Analytical Data**

Atlantic Richfield Company Service Station # 6148  
5131 Shattuck Avenue  
Oakland, California

---

TPH = Total Petroleum Hydrocarbons

MTBE = Methyl tertiary butyl ether analyzed by EPA Method 8021B unless otherwise noted (Prior to 2/5/03)

µg/L = Milligrams per liter

mg/L = Micrograms per liter

NA = Not available

NS = Not Sampled

ND< = Not detected above specified laboratory detection limit

P = Purge

NP = No Purge

1 = Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.

2 = Chromatogram Pattern: Gasoline C6-C10

3 = Well MW-5 not sampled due to ORC sock wedged in well.

4 = TPH-g, BTEX, and MTBE analyzed by EPA method 8260B beginning on 1st Quarter Sampling Event (2/5/03)

5 = pH and dissolved oxygen are field measurements.

6 = During this monitoring event, the oxygen releasing compounds (ORC) were replaced for this well.

Source: The data within this table collected prior to August 2002 was provided to URS by Group Environmental Management Company and their previous consultants. URS has not verified the accuracy of this information.

**Notes:**

Results in **BOLD** exceed California RWQCB ESLs for TPH-g of 100 mg/kg during initial investigations

TPH-g total petroleum hydrocarbons as gasoline

bgs below ground surface

mg/kg milligrams per kilograms

**Table 3**  
**Confirmation Soil Samples and Rational**

Atlantic Richfield Company  
Service Station #6148  
5131 Shattuck Boulevard

Oakland, California

Sample ID	Rational for Soil Boring Location
CSB-1-17.5	Approximate location of soil boring B1/MW-1 (TPH-g = 470 mg/kg at 17.5 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-2-14.0	Approximate location of soil boring B2/MW-2 (TPH-g = 740 mg/kg at 14 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-2-18.0	
CSB-3-17.5	Approximate location of soil boring B3/MW-3 (TPH-g = 320 mg/kg at 17.5 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-4-16.5	Approximate location of soil boring B6/MW-5 (TPH-g = 190 mg/kg at 16.5 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-4-19.0	
CSB-5-15.5	Approximate location of soil boring TB-4 (TPH-g = 470 mg/kg at 15 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-5-18.0	
CSB-6-16.0	Approximate downgradient/cross-gradient location of soil borings TN-1 and T1-C (TPH-g = 4,470 mg/kg and 961mg/kg, respectively at 16 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-8-2.0	Approximate location of soil boring DP-2 (TPH-g = 132 mg/kg at 2 feet bgs). Soil confirmation sample to evaluate effectiveness of site work.
CSB-9-6.0	
CSB-9-11.5	
CSB-9-16.5	Approximate median location of soil borings TB-7, VW-6, and DP-5(TPH-g = 610 mg/kg at 16.5 feet bgs 3,100 mg/kg at 6 feet bgs, and TPH-g = 2,390 mg/kg at 2 feet bgs, respectively). Soil confirmation sample to evaluate effectiveness of site work and investigate vertical extent of soil contamination in VW-6 and DP-5.
CSB-9-21.5	
CSB-9-26.5	

**Key:**

- XXX-X-17.5 = XXX-X is Sample Location
- CSB-1-XX.X = XX.X is Sample Depth in feet bgs
- bgs = below ground surface

Dear Mr. Supple:

Subject: Fuel Leak Case No. R00000077, Arco #6148, 5131 Shattuck Ave., Oakland, CA

Alameda County Environmental Health (ACEH) staff has reviewed the Leaking Underground Storage Tank Oversight Program file including "3<sup>rd</sup> Quarter 2003 Groundwater Monitoring Report" dated August 30, 2003 prepared by URS Corp. The case appears to be close to closure. We request that you address the following technical comments and send us the technical reports requested below.

#### TECHNICAL COMMENTS

##### Verification Monitoring

- a) Soil - Soil concentrations of concern were 2,390 mg/kg Total Petroleum Hydrocarbons as Gasoline (TPH-G) detected in DP-5 on February 1, 2001, 3,100 mg/kg TPH-G in VW-6 on August 3, 1995. DP-5 does not appear to have been over excavated. However, Soil-Vapor Extraction (SVE) and Air-Sparge (AS) systems were used at the site from September 1995 until January 2000 to remediate impacted groundwater and saturated soils beneath the site. Please submit a work plan to sample soil to evaluate the effectiveness of the site work and to investigate the vertical extent of soil contamination at DP-5 and VW-6.
- b) Groundwater - Please continue groundwater monitoring for two more quarters. Then evaluate the effectiveness of the site work.

#### TECHNICAL REPORT REQUEST

Please submit technical reports to Alameda County Environmental Health (Attention: Don Hwang), according to the following schedule:

December 20, 2003 – Work Plan  
60 days after Work Plan approval – Soil and Water Investigation Report

Mr. Supple  
October 20, 2003  
Page 2 of 2

These reports are being requested pursuant to the Regional Water Quality Control Board's (Regional Board) authority under Section 13267 of the California Water Code. If you have any questions, please call me at (510) 567-6746.

Sincerely,

Don Hwang  
Hazardous Materials Specialist  
Local Oversight Program

**Table C. ENVIRONMENTAL SCREENING LEVELS (ESLs)**  
**Deep Soils (<3m bgs) Groundwater IS Current or Potential Source of Drinking Water**  
**(California Regional Water Quality Control Board; Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Volume 1, July 2003)**

**Table K-3. ENVIRONMENTAL SCREENING LEVELS (ESLs)**  
**Direct Exposure Screening Levels: Construction/Trench Worker Exposure Scenario**  
**(California Regional Water Quality Control Board; Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Volume 2, July 2003)**

**TABLE C: DEEP SOIL (>3M BGS) - WATER IS A  
CURRENT OR POTENTIAL SOURCE OF  
DRINKING WATER**

**Notes:**

- Always compare final soil data for commercial/industrial sites to residential ESLs and evaluate need for formal land-use restrictions (see Section 2.9).
- ESLs for deep soils may be applicable to soils <3m below ground surface at commercial/industrial sites provided institutional controls are put in place to maintain an adequate cap and provide proper management of soil if exposed in future (see Section 2.4 and Section 2.9).

Electrical Conductivity (mS/cm, USEPA Method 120.1 MOD)	not applicable	not applicable	not applicable
Sodium Adsorption Ratio	not applicable	not applicable	not applicable

**Notes:**

1. Deep soils defined as soils greater than 3 meters (approximately 10 feet) below ground surface.

2. Category "Residential Land Use" generally considered adequate for other sensitive uses (e.g., day-care centers, hospitals, etc.)

3. Assumes potential discharge of groundwater into a freshwater, marine or estuary surface water system.

Source of soil ESLs: Refer to Appendix 1, Tables C-1 and C-2.

Source of groundwater ESLs: Refer to Appendix 1, Table F-1a.

Soil data should be reported on dry-weight basis (see Appendix 1, Section 6.2).

Soil ESLs intended to address human health, groundwater protection and nuisance concerns under a construction/trench worker exposure scenario and noted land-use scenarios. Soil gas data should be collected for additional evaluation of potential indoor-air impacts at sites with significant areas of VOC-impacted soil. See Section 2.6 and Table E.

Groundwater ESLs intended to be address drinking water, surface water, indoor-air and nuisance concerns. Use in conjunction with soil gas screening levels to more closely evaluate potential impacts to indoor-air if groundwater screening levels for this concern approached or exceeded (refer to Section 2.6 and Appendix 1, Table F-1a).

Aquatic habitat goals for bioaccumulation concerns not considered in selection of groundwater goals (refer to Section 2.7). Refer to appendices for summary of ESL components.

TPH -Total Petroleum Hydrocarbons. TPH ESLs must be used in conjunction with ESLs for related chemicals (e.g., BTEX, PAHs, oxidizers, etc.). See Volume 1, Section 2.2 and Appendix 1, Chapter 6.

Notes:

See text for equations and assumptions used in models.

Final screening level is lowest of individual screening levels for carcinogenic effects and noncarcinogenic effects (based on HQ=0.2) or screening level for construction/trench workers if lower (see Table K-3). Saturation limit used as upper limit for volatile organic compounds that are liquid at ambient conditions (see text).

Carcinogens: Based on target cancer risk of 10<sup>-6</sup>, modified with respect to CalEPA/OEHHA slope factors when available (marked by \*). Screening levels for PCBs based on updated USEPA slope factors as presented in USEPA Region IX Preliminary Remediation Goals document (USEPA 2002).

Noncarcinogens: Adjusted to target hazard quotient of 0.2 for use in tables. Screening levels based on hazard quotient of 1.0 provided for reference.

Saturation: Theoretical soil saturation level in the absence of free product; calculated for volatile organic compounds that are liquids under ambient conditions (refer to Table J).

TPH: Total Petroleum Hydrocarbons. See text for discussion of different TPH categories. Direct exposure screening levels after Massachusetts Department of Environmental Protection (see text).

Residential screening level for lead from Interim Guidance for Evaluating Lead-Based Paint and Asbestos Containing Materials at Proposed School Sites (DTSC 2001).

**LABORATORY PROCEDURES,  
CERTIFIED ANALYTICAL REPORTS,  
AND CHAIN-OF-CUSTODY RECORDS**

## **LABORATORY PROCEDURES**

---

### **Laboratory Procedures**

The groundwater samples were analyzed for the presence of the chemicals mentioned in the chain of custody using standard EPA methods. The methods of analysis for the groundwater samples are documented in the certified analytical report. The certified analytical reports and chain-of-custody record are presented in this attachment. The analytical data provided by the laboratory approved by the Atlantic Richfield Company have been reviewed and verified by that laboratory.

Attached is our report for your samples received on 04/29/2004 18:50  
This report has been reviewed and approved for release. Reproduction of this report  
is permitted only in its entirety.

The report contains a Case Narrative detailing sample receipt and analysis.

Please note that any unused portion of the samples will be discarded after  
06/13/2004 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,  
please call me at (925) 484-1919.

You can also contact me via email. My email address is: [asalimpour@stl-inc.com](mailto:asalimpour@stl-inc.com)

Sincerely,

Afsaneh Salimpour

## Case Narrative

## General and Sample Comments

We (STL San Francisco) received 16 Soil samples , on Thursday, April 29, 2004  
6:50 PM.

## Analysis Comments and Flags by QC Batch

Total Lead	Soil	QC Batch#: 2004/04/30-04.15
DG-001 >> MS Compound Flag(s) mso	MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Accuracy were verified by LCS/LCSD.	2004/04/30-04.15-045
DG-001 >> MSD Compound Flag(s) mso	MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Accuracy were verified by LCS/LCSD.	2004/04/30-04.15-046
Volatile Organic Compounds by 8260B (High Level)	Soil	QC Batch#: 2004/05/13-02.71
CSB-2-18.0 Analysis Flag(s) o	Reporting limits were raised due to high level of analyte present in the sample.	2004040929 014
CSB-2-18.0 Compound Flag(s) sd	Surrogate recovery not reportable due to required dilution.	2004040929 014
Gas/BTEX Fuel Oxygenates by 8260B (for BP)	Soil	QC Batch#: 200405102C69
CSB-9-26.5 Compound Flag(s) g	Hydrocarbon reported in the gasoline range does not match our gasoline standard.	2004040929 005
DRUM 1 Compound Flag(s) g	Hydrocarbon reported in the gasoline range does not match our gasoline standard.	2004040929 010

---

**Legend and Notes**

---

**Result Flag**

g

Hydrocarbon reported in the gasoline range does not match our gasoline standard.

sh

Surrogate recovery was higher than QC limit due to matrix interference.

### Sample Receipt Checklist

Submission #: 2004-04 - 0929

Checklist completed by: (initials) DM Date: 04/30/04

Courier name:  STL San Francisco  Client

Custody seals intact on shipping container/samples

Chain of custody present?

Chain of custody signed when relinquished and received?

Chain of custody agrees with sample labels?

Samples in proper container/bottle?

Sample containers intact?

Sufficient sample volume for indicated test?

All samples received within holding time?

Container/Temp- Blank temperature in compliance ( $4^{\circ}\text{C} \pm 2$ )?

Water - VOA vials have zero headspace?

	Yes	No	Not Present
Chain of custody present?	Yes	✓	No
Chain of custody signed when relinquished and received?	Yes	✓	No
Chain of custody agrees with sample labels?	Yes	✓	No
Samples in proper container/bottle?	Yes	✓	No
Sample containers intact?	Yes	✓	No
Sufficient sample volume for indicated test?	Yes	✓	No
All samples received within holding time?	Yes	✓	No
Container/Temp- Blank temperature in compliance ( $4^{\circ}\text{C} \pm 2$ )?	Temp: <u>4.0</u> °C	Yes	✓ No
Water - VOA vials have zero headspace?	No VOA vials submitted	Yes	✓ No

(If bubble is present, refer to approximate bubble size and itemize in comments as S (small ~○), M (medium ~○) or L (large ~○))

Water - pH acceptable upon receipt?  Yes  No 5.0

pH adjusted- Preservative used:  HNO<sub>3</sub>  HCl  H<sub>2</sub>SO<sub>4</sub>  NaOH  ZnOAc - Lot # (s)

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments:
