Subject: Former Val Strough Chevrolet Site
327 34th Street, Oakland, CA
Site ID #3035, RO#0000134

Dear Ms. Jakub:

This enclosed report has been prepared by LRM Consulting, Inc. on behalf of the Strough Family Trust. I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report is true and correct to the best of my knowledge.

If you have any questions, please contact Mr. Mehrdad Javaherian of LRM Consulting, Inc. at 650-343-4633.

Sincerely,

A handwritten signature in black ink, appearing to read 'Linda L. Strough', with a large, stylized flourish at the end.

Linda L. Strough, Trustee

1.0 INTRODUCTION

At the request of the Strough Family Trust of 1983, LRM Consulting, Inc. (LRM) has prepared this *Fourth Quarter 2014 Post Remediation Groundwater Monitoring Report* for the former Val Strough Chevrolet located in Oakland, California. This report documents the procedures and findings of the December 18, 2014 groundwater monitoring event reflecting water level and/or quality reporting for all existing onsite wells per the augmented monitoring programmed discussed with the Alameda County Health Care Services Agency (ACHCSA). This monitoring event marks the second of four post-remediation rounds of quarterly monitoring planned following termination of high-vacuum dual phase extraction (HVDPE) operations on June 20, 2014, and in support of site closure.

The scope of groundwater monitoring for this quarter corresponded to gauging and sampling from the eleven onsite monitoring wells (MW1, MW2, MW3, MW4, MW5, MW6, MW7, MW8, MW9A, MW9B, and O1).

1.1 General Site Information

Site name:	Former Val Strough Chevrolet
Site address:	327 34 th Street, Oakland, California
Current property owner:	Strough Family Trust of 1983
Current site use:	Automotive Dealership and Service Center
Current phase of project:	Groundwater monitoring and evaluation of need and approaches for additional remediation
Tanks at site:	Two former tanks (1 gasoline, 1 waste-oil) removed in 1993
Number of wells:	12 (all onsite)
Site ID #:	3035
RO #:	0000134

1.2 Site Contacts

Consultant:	Mehrdad Javaherian, Ph.D., MPH, PE, LEED [®] GA LRM Consulting, Inc. 1534 Plaza Lane, # 145 Burlingame, CA 94010 (415) 706-8935

2.0 SITE BACKGROUND

2.1 Site Description

Site Location and Land Use: The former Val Strough Chevrolet site is currently an active Honda automobile dealership and service center located on the southwestern corner of the intersection of Broadway (Auto Row) and 34th Street (Figure 1). The property is located south of Interstate 580. Land use in the area is primarily commercial.

The site is situated approximately two miles east of San Francisco Bay at approximately 61 feet above mean sea level (msl) (Environmental Data Resources [EDR], 2003). The land surface in the vicinity slopes downward toward the south. The nearest surface water body is Lake Merritt, located approximately 1 mile south of the site (Figure 1).

Site Features: The site consists of a multi-level building and an adjacent parking lot (Figure 2). The former fuel dispenser and underground storage tanks (USTs) were located in the northwestern portion of the site. Eleven groundwater monitoring wells are located at the site (see Figure 2). Construction details for the wells are presented in Table 1.

Underground Utilities: A box culvert for a former tributary of Glen Echo Creek is located approximately 17 feet below ground surface (bgs) in the eastern portion of the site (Figure 2). The culvert consists of a reinforced concrete box measuring 5 feet by 6 feet. During the winter of 1983, a section of the culvert collapsed and was replaced with a 5-foot-diameter pipeline.

Sanitary sewer, electrical, and natural gas utilities are generally present at depths less than 2 feet bgs at the site. Approximately 40 feet north of the site, along the northern edge of 34th Street, a storm sewer pipeline routes storm water and waste water toward the east and into the box culvert. Sanitary sewer lines trend parallel to both 34th Street and Broadway, north and east of the site, respectively. A lateral pipeline located along the western edge of the site connects to the sanitary sewer line below 34th Street. Natural gas service is located on the east side of the site. Water service appears to enter the site from the north.

Water Supply Well Search: A 2003 report compiled by EDR indicates that there are no federal U.S. Geological Survey wells and no public water supply wells located within a 1-mile radius of the site. No water supply wells were identified by the Alameda County Department of Public Works within a ½-mile radius of the site (ETIC Engineering, Inc. [ETIC], 2003).

2.2 Summary of Previous Investigations and Monitoring Activities

As presented in previous reports, the USTs were removed and multiple investigations were conducted; eleven groundwater monitoring wells were installed on the site during these investigations. In addition, a routine groundwater monitoring program has been in place since 1993. The following paragraphs summarize the findings of these activities.

Site Hydrogeology: In general, the site is underlain by silt and clay to depths ranging from approximately 15 to 20 feet bgs. Silty sand and fine-grained sand interbedded with thin clay intervals are encountered from approximately 20 feet bgs to the total explored depth of 40 feet bgs.

The depth to groundwater beneath the site has ranged from approximately 12.5 to 25 feet bgs. As shown in the modified rose diagram on Figure 2, the direction of groundwater flow is generally toward the southwest to south-southeast, with average hydraulic gradients ranging from approximately 0.01 to 0.03 foot/foot.

Primary Sources: Two USTs (one gasoline and one waste-oil) were located beneath the sidewalk on the northern side of the site. A fuel dispenser was located inside the building (Figure 2). These primary sources of petroleum hydrocarbons were removed from the site in 1993.

Constituents of Potential Concern: Based on the type of fuel stored in the USTs and the results of previous subsurface investigations, the constituents of potential concern (COPCs) at the site include total petroleum hydrocarbons (TPH) quantified as gasoline (TPH-g), benzene, toluene, ethylbenzene, and total xylenes (collectively BTEX), and methyl t-butyl ether (MTBE). TPH quantified as diesel (TPH-d) and TPH quantified as motor oil (TPH-mo) are not routinely detected in groundwater samples and are considered secondary COPCs for the site.

Residual Source Area: Elevated concentrations of TPH-g, BTEX, and MTBE have been observed in soil in the vadose zone and upper portion of the water-bearing zone near the former USTs and fuel dispenser. Separate phase petroleum hydrocarbons (SPH) have been intermittently detected in wells MW2, MW3, and MW9A, and have been subject to removal via hand-bailing upon detection. The available data suggest that most of the residual petroleum hydrocarbon mass is present near the former USTs and fuel dispenser, herein referred to as the residual source area; this is corroborated by the dissolved groundwater data discussed below. Additional wells installed within this residual source area include MW9A/9B and O1, in addition to DPE1.

Petroleum Hydrocarbon Distribution in Groundwater: The highest historical concentrations of petroleum hydrocarbons have been detected in samples collected from wells MW2, MW3, MW9A/9B, and O1, located immediately downgradient of the former USTs and within the previously defined residual source area. Significantly lower levels of petroleum hydrocarbons

have been detected in samples collected from well MW4 and the other site wells located downgradient and outside of the residual source area. The extent of dissolved-phase petroleum hydrocarbons in groundwater is largely defined by relatively low and stable TPH-g, BTEX, and MTBE concentrations detected in downgradient and cross-gradient monitoring wells MW5, MW6, MW7, and MW8 (Tables 2 and 3). The residual source area was accordingly targeted for DPE remediation as discussed below.

2.3 Summary of Interim Remedial Action Activities

In addition to the routine groundwater monitoring activities, remediation pilot testing and remediation activities were conducted at the site between 2004 and 2006. A summary of these activities and associated regulatory correspondence with the ACHCSA are presented below.

DPE Pilot Test: In March 2004, ETIC performed a DPE pilot test at the site. As summarized in the June 2004 *Dual Phase Extraction Pilot Test and Interim Remedial Action Plan* (DPE and IRAP Report), vacuum was applied to source area wells MW2 and MW3 while water and vacuum levels were measured in nearby monitoring wells. The DPE pilot test induced more than 1 foot of drawdown up to 50 feet from the extraction wells and an estimated radius of vacuum influence of 55 to 70 feet. Based on vapor flow rates and petroleum hydrocarbon concentrations in the vapor stream during the short-term pilot test, removal rates of approximately 90 pounds of petroleum hydrocarbons per day were estimated.

June 2004 DPE and IRAP Report: The DPE and IRAP Report (ETIC, 2004) described the planned reduction of residual petroleum hydrocarbon mass in the source area through installation and temporary operation of a DPE system and dual phase extraction (extracting soil vapor and groundwater simultaneously) from source area wells MW-2 and MW-3. The system was designed to consist of a knockout vessel to be used for separation of the soil vapor and water streams. A thermal oxidizer (with propane as a supplemental fuel) was proposed for treatment of extracted vapor, and aqueous-phase granular activated carbon was proposed for treatment of extracted groundwater.

Interim Remedial Action: Between February 2005 and June 2006, ETIC operated a DPE system on site. Vacuum was applied to remove groundwater and soil vapor from up to two wells (MW2 and/or MW3). The system was temporarily shutdown on January 30, 2006 for conversion of vapor treatment from thermal oxidation to carbon filtration, and remained offline until May 22, 2006, when it was restarted. Because the mass removal rates by the DPE system had reached asymptotic levels and high petroleum hydrocarbon concentrations continued to exist in extraction wells MW2 and MW3 despite the DPE operation, the benefit of continuation of DPE in its current configuration was considered to be low and the DPE operation was ceased on June 30, 2006. ETIC subsequently dismantled the remediation system and removed the skid mounted DPE unit from the site.

August 2006 LRM Consulting, Inc. Correspondence and 11 December 2006 LRM Supplemental Source Area Investigation Work Plan: In an August 25, 2006 correspondence, LRM notified ACHCSA of a project consultant change from ETIC to LRM. Also, based on a review of the available site data, the response of the petroleum hydrocarbon concentrations to past DPE operations, and ACHCSA's comments on ETIC's Work Plan, LRM recommended a technical meeting with ACHCSA to discuss the project direction. However, because of other commitments of Mr. Don Hwang and other ACHCSA staff, a technical meeting could not be scheduled. During an October 19, 2006 telephone conversation with Mr. Hwang, LRM presented an approach to conduct a supplemental investigation to define the magnitude and extent of the residual source area in the vicinity of the former fuel dispenser and wells MW2 and MW3. Based on these discussions and as agreed by Mr. Hwang, a supplemental source area investigation work plan outlining the proposed scope of work was prepared and submitted to ACHCSA on December 11, 2006. This work plan was revised through multiple discussions with Ms. Donna Drogos of ACHCSA and was finalized in December of 2007. The subject investigation was conducted beginning on December 12, 2007; the results of the investigation were documented in a report to ACHCSA (LRM, 2008a).

August 2008 –September 2010. LRM Consulting, Inc. IRAP Activities: In response to a request by Ms. Barbara Jakub of ACHCSA, LRM proposed a series of site investigation and pilot testing activities to address the residual source area at the site in the August 25, 2008 IRAP report. These activities included: 1) soil and grab groundwater sampling to vertically characterize the extent of petroleum hydrocarbons within the residual source area previously encountered during the supplemental investigation referenced above; 2) grab groundwater sampling along the existing culvert at the site to evaluate the potential for preferential migration of petroleum hydrocarbons along the culvert backfill; 3), placement of a groundwater monitoring well (MW8) at the downgradient site boundary to define the downgradient extent of petroleum hydrocarbons; and 4) pilot testing activities including injection and observation well installation and pilot testing protocols for implementation of in-situ oxygen curtain (iSOC) technology within the residual source area.

The investigation activities associated with the IRAP, including installation of additional monitoring wells MW9A and MW9B, were completed by July 2009. On January 13, 2010, an addendum to the IRAP was prepared by LRM, reflecting a proposed change from iSOC technology originally outlined in the IRAP, due to petroleum hydrocarbon concentrations which were determined to be too elevated for treatment via iSOC technology. Specifically, pilot testing of in-situ chemical oxidation (ISCO) technology was proposed for the residual source area instead of iSOC. The IRAP Addendum was approved by ACHCSA in their letter dated April 22, 2010.

The IRAP pilot testing included three rounds of RegenOx injections from August 15 through September 13, 2010 within a depth interval of 15 to 40 feet bgs, per the approved IRAP.

IRAP activities were reported to ACHCSA via a Technical Memorandum dated October 6, 2010, with post-injection groundwater monitoring results documented in subsequent groundwater monitoring events. To summarize, over 9,500 gallons of RegenOx were injected into the residual source area via 20 direct-push borings during the three injection events. The table below summarizes the pre- and post-injection groundwater concentrations within the residual source area.

**Pre- and Post-Injection Groundwater Quality Data
 Former Val Strough Chevrolet Site, Oakland, CA**

Well Number	Date	SPH Thickness (feet)	Concentration (µg/L)					DO (mg/L)	Comment	
			Benzene	Toluene	Ethyl-benzene	Total Xylenes	TPH-g			
MW2	05/28/10	0.00	260	1,100	650	4,700	23,000	2	Pre-injection event	
MW2	08/26/10	0.00	160	980	490	4,200	22,000	16	Sampling following first injection event	
MW2	09/20/10	0.00	52	360	210	1,600	8,800	18	Sampling following third injection event	
MW2	12/22/10	0.00	130	1,100	430	6,000	26,000	1.6	Sampling two months after final (3rd) injection event	
MW2	03/16/11	0.00	430	1700	490	3,700	29,000	3.5	Sampling six months after final (3rd) injection event	
MW3	05/28/10	0.00	1,200	4,600	920	4,800	31,000	2	Pre-injection event	
MW3	08/26/10	sheen	Not Sampled due to Free Product							Sampling following first injection event
MW3	09/20/10	SPH Sheen-Removed	2,700	13,000	2,900	18,000	110,000	11.3	Sampling following third injection event	
MW3	12/22/10	0.20	Not Sampled due to Free Product							Sampling two months after final (3rd) injection event
MW3	03/16/11	0.00	4,000	16,000	2,800	15,000	91,000	4.2	Four weekly SPH bailing events performed from 1/6/11 to 2/6/11. No SPHs detected after 2/6/11. Sampling six months after final (3rd) injection event	
MW9A	05/28/10	0.02	Not Sampled due to Free Product							Pre-injection event
MW9A	08/26/10	0.00	2,600	19,000	3,000	22,000	150,000	10.3	Sampling following first injection event	
MW9A	09/21/10	0.00	1,400	9,600	1,600	12,000	70,000	20.9	Sampling following third injection event	
MW9A	12/22/10	0.00	4,400	17,000	1,900	13,000	83,000	NA	Sampling two months after final (3rd) injection event	
MW9A	03/16/11	0.00	4,900	22,000	2,800	20,000	130,000	1.5	Sampling six months after final (3rd) injection event	
MW9B	05/28/10	0.00	31	75	150	270	2,900	2	Pre-injection event	
MW9B	08/26/10	0.00	13	160	310	2,000	14,000	40	Sampling following first injection event	
MW9B	09/20/10	0.00	6.7	110	140	830	6,200	26.9	Sampling following third injection event	
MW9B	12/22/10	0.00	<0.5	2.6	1.1	9.9	140	5.3	Sampling two months after final (3rd) injection event	
MW9B	03/16/11	0.00	22	39	47	290	3,500	4.5	Sampling six months after final (3rd) injection event	
O1	05/28/10	0.00	610	2,000	1,000	4,200	21,000	1.4	Pre-injection event	
O1	08/26/10	0.00	29	160	59	680	5,000	39	Sampling following first injection event	
O1	09/20/10	0.00	24	140	28	330	2,000	24.7	Sampling following third injection event

O1	03/16/11	0.00	200	440	240	850	6,900	2.8	Sampling six months after final (3rd) injection event	

Notes:

Data collected on 5/28/10 represents baseline sampling event and corresponds to 2nd Quarter 2010 groundwater monitoring event
 Data collected on 8/26/10 represents sampling event following first round of RegenOx injection that was conducted from August 15 to 17, 2010.
 Data collected on 9/20/10 represents sampling event following the third round of RegenOx injection that was conducted from September 12 to 13, 2010.

As indicated in the above table, the following observations were made in each of the following wells:

- MW2: ISCO injections resulted in a reduction in TPH-g concentrations from 23,000 ug/L to 8,800 ug/L; however, within two to six months after the final injection event, the TPH-g concentrations rebounded to pre-injection concentrations.

- MW3: ISCO injections appear to have induced migration of SPHs from the surrounding area into this well; hence, sampling of groundwater was limited in this well during ISCO activities. SPHs have been bailed out of this well per ACHCSA request and TPH-g concentrations remain at elevated levels.
- MW9A: ISCO injections resulted in a decline in TPH-g concentration from a pre-injection concentration of 150,000 ug/L to a post-injection concentration of 70,000 ug/L. Six months following the final injection event, the TPH-g concentrations rebounded to pre-injection concentrations.
- MW9B: TPH-g concentrations increased from 2,900 ug/L to 14,000 ug/L following the first injection event (likely due to dissolution of adsorbed petroleum hydrocarbons in soils), but declined significantly (to 140 ug/L) during the subsequent injection events. Six months following termination of injection activities, the TPH-g concentration in this well rebounded to pre-injection levels.
- O1: TPH-g concentrations in this well declined from a pre-injection concentration of 21,000 ug/L to post-injection concentration of 460 ug/L. Rebounded concentrations (6,900 ug/L) remain significantly below the pre-injection concentration six months after the final injection event.

Based on the ISCO pilot test results, it is evident that ISCO can be an effective technology in reducing hydrocarbon concentrations within the residual source area, including dissolution of concentrated hydrocarbons adsorbed to soils and reductions of dissolved TPH-g concentrations from 150,000 ug/L to 70,000 ug/L in a short period. The pilot test further revealed the ability of this technology to increase dissolved oxygen (DO) levels in injection areas, creating conditions for longer-term, natural biodegradation; however, the post-pilot test results further indicate that a significant hydrocarbon mass, including residual SPHs, remains trapped in the fine-grained soils within the localized residual source area, capable of yielding elevated dissolved concentrations following cessation of ISCO injections.

While SPHs observed during the pilot testing were bailed and remained absent during the two quarterly monitoring events (including the second quarter 2011 monitoring event) following the pilot testing, SPHs remain trapped near existing monitoring wells within the residual source area; this is evidenced by the results of the 4th Quarter 2011 monitoring event. Combined, these data suggest that a larger-scale application (i.e., compared to a pilot-scale application applied per the IRAP) of RegenOx is necessary to reduce and maintain lower levels of hydrocarbon impacts in groundwater within the residual source area; however, these applications may be greatly benefited by a broader effort to remove SPHs in advance of the ISCO injections.

To this end and per ACHCSA's request, LRM prepared a Corrective Action Plan (CAP) which has been approved and finalized following completion of ACHCSA and the public

review process. The CAP outlined two preferred remedial alternatives to address groundwater and SPH impacts in the residual source area, with permitted DPE activities to address SPHs initiated on July 2, 2012. As discussed below, the DPE system was operated from June 2012 through June 2014, with this report marking the first post-remediation quarterly groundwater monitoring event approximately three months following termination of the DPE system.

2.4 Full-Scale DPE Remediation Activities

Full-scale remediation of hydrocarbons within the residual source area using DPE was performed from June 2012 through June 2014. This included DPE applied to MW-2, MW-3, and DPE-1, located within the residual source area.

Based on O&M sapling results summarized in Tables 4 and 5, a total cumulative mass of 5,263 pounds of TPH-g in vapor phase has been removed from June 2012 through June 2014. During this period, an additional 35.4 pounds of TPH-g has been removed in liquid phase. As discussed later herein, the mass removal referenced above resulted in continued declines in hydrocarbon concentrations in most source area wells.

DPE operations were terminated on June 20, 2014 in response to both reduced hydrocarbon levels in groundwater, but also measurable reductions in hydrocarbon mass removal rates through DPE. This round of monitoring marks the second of four post-remediation quarterly groundwater monitoring events in support of site closure.

3.0 PROTOCOLS FOR GROUNDWATER MONITORING

The following sections of this report present information relevant to the methods employed during the collection of groundwater samples from site wells on December 2018. The scope of work for the quarterly groundwater monitoring event at the site is listed below.

- Checking wells for SPHs.
- Gauging the depth to groundwater in eleven site wells.
- Purging the monitoring wells prior to sampling.
- Collecting and analyzing groundwater samples from all onsite wells.
- Estimating the hydraulic gradient and general flow direction.
- Evaluating the data and preparing a written report summarizing the results of the monitoring event.

3.1 Groundwater Gauging

For this round of monitoring, groundwater gauging was performed for eleven onsite wells. The monitoring wells were opened prior to gauging to allow the groundwater level to

equilibrate with atmospheric pressure. The depth to groundwater and depth to SPH, if present, were then measured to the nearest 0.01 feet using an electronic water level meter or optical interface probe. The measurements were made from a fixed reference point at the top of the well casing. Field data forms are presented in Appendix A, indicating the absence of SPHs within the residual source area during this round of monitoring.

3.2 Well Purging

Following well gauging, three well casing volumes of water were purged from wells scheduled to be sampled, and field parameters including temperature, pH, specific conductance, turbidity, dissolved oxygen (DO) and oxidation-reduction potential (ORP) were measured; these data are summarized in Appendix A.

3.3 Groundwater Sampling

After purging, groundwater was collected at each well scheduled to be sampled using dedicated tubing and a WaTerra inertial pump, or a disposable bailer. Sample containers were sealed, labeled, stored in a cooler and transported under chain-of-custody protocol to Kiff Analytical LLC (Kiff), a state-certified analytical laboratory in Davis, California.

Groundwater analytical results and chain-of-custody documentation are presented in Appendix B.

4.0 MONITORING RESULTS

4.1 Separate-Phase Hydrocarbon Monitoring

The wells were monitored for the presence of SPH using a disposable bailer and/or interface probe. SPHs were not detected during this round of monitoring, marking the 10th consecutive quarter where SPHs have remained absent from the site.

4.2 Groundwater Elevation and Hydraulic Gradient

The groundwater elevation contour map (Figure 2) for this monitoring event was constructed based on depth-to-groundwater measurements collected during the current sampling event. Depth-to-groundwater measurements and calculated groundwater elevations are presented in Table 2.

On December 18, 2014, the depth to groundwater beneath the site ranged from 11.44 (MW8) to 20.85 (MW5) feet bgs (Table 2). Using the results from the fourth quarter 2014 groundwater monitoring event, the hydraulic gradient is estimated at an average of 0.016 ft/ft, with a general flow direction away from the residual source area toward the southwest (see Figure 2).

4.3 Groundwater Analytical Results

On December 18, 2014, groundwater samples were collected from wells MW1, MW2, MW3, MW4, MW5, MW6, MW7, MW8, MW9A, MW9B, and O1, and analyzed by Pace Analytical (formerly Kiff Analytical, Inc.) of Davis, California for TPH-g, BTEX, and MTBE by U.S. Environmental Protection Agency (EPA) Method 8260B and for TPH-d and TPH-mo by modified EPA Method 8015 with silica gel cleanup.

Analytical results for this event are presented on Figure 3, and current and historical petroleum hydrocarbon analytical results are presented in Table 2. Copies of the chain-of-custody and laboratory analytical reports for the groundwater samples are presented in Appendix B. Key analytical results for petroleum hydrocarbons are summarized below:

- As indicated on Figure 3, downgradient wells continue to report the absence of hydrocarbons above detection limits, with the residual hydrocarbon plume limited in extent and entirely contained within the residual source area (i.e., near wells MW-2, MW-9A) and well within the site boundaries.
- TPH-g was detected in samples collected from wells MW2, MW3, MW9A, MW9B, O1, and DPE-1, with concentrations in downgradient/cross-gradient wells MW-4, MW-5, MW-6, MW-7, and MW-8 remaining below detection limits. The maximum TPH-g concentration was detected at residual source area well MW9A (46,000 micrograms per liter [ug/L]) which is a slight decline compared to the concentration (51,000 ug/L) detected in this well in September 2014. TPH-did increase at residual source area well MW2 (from 6,300 ug/L to 23,000 ug/L) relative to the September 2014 monitoring event, marking a slight rebound since termination of the PE system in late June 2014. TPH-g in all other residual source area wells previously targeted for remediation either declining or remaining at approximately the same levels as in September 2014.
- Benzene remains sparsely detected at the site, with detections above reporting limits in the samples collected from wells MW2, MW3, MW9A, MW9B, O1, and DPE-1. The maximum benzene concentration detected remains at residual source area well MW9A, declining from 370 ug/L in September 2014 to 150 ug/L in December 2014. Benzene concentrations in other residual source area wells MW2 (92 ug/L), MW3 (0.92 ug/L), O-1 (12 ug/L), DPE-1 (120 ug/L) remain at levels below or approximately the same as those detected in September 2014.
- MTBE was detected in the samples from wells MW1, MW2, MW-3, MW4, MW6, MW9B, O1, and DPE-1, remaining absent in onsite downgradient well MW-8 and residual source area well MW-9A. The maximum MTBE concentration of 200 ug/L occurred in well MW4. This closely approximates the MTBE concentration 9190 ug/L reported in this well in September 2014. MTBE concentrations in other wells referenced above occurred at residual levels and below or similar to levels in September 2014.

The chart below depicts TPH-g concentration trends for wells MW2, MW3, and MW9A, and DPE1, located within the residual source area. The hydrocarbon concentrations in three of the four residual source area wells continue to exhibit a declining or stable trend approximately 6 months after termination of the DPE system, with distinct declines in MW-9A, stable concentrations in DPE-1, and a negligible increase at MW-3. MW-2 is the only well with a measurable increase in TPH-g concentrations; however, it should be noted that benzene (and other hydrocarbon constituents) continue to remain generally stable and at residual levels in all source area wells. As previously indicated, wells downgradient of these residual source area wells continue to exhibit hydrocarbon levels at or below detection limits. Based on these results, absent any significant changes in results over the next two quarters, the site remains a strong candidate for closure and will be accordingly petitioned.

5.0 PLANNED ACTIVITIES

With the results of this monitoring event indicating the continued stability of hydrocarbons in the residual source area, the limited extent of the hydrocarbon plume away from the residual source area, and the absence of a threat of offsite migration of hydrocarbons, the DPE system will remain terminated and the third of four planned post-remediation quarterly monitoring events is scheduled for March, 2015.

SPH Separate-phase hydrocarbons.

GW Groundwater.

TPH-g Total Petroleum Hydrocarbons quantified as gasoline.

TPH-d Total Petroleum Hydrocarbons quantified as diesel.

TPH-mo Total Petroleum Hydrocarbons quantified as motor oil.

MTBE Methyl tertiary butyl ether.

TBA Tertiary Butyl Alcohol

NC Not calculated.

NS Not surveyed

µg/L Micrograms per liter.

* SPH present; not sampled.

** Well MW4 elevation modified due to site renovation activities. Not Surveyed.

-- Not analyzed or not sampled.

< Less than the laboratory reporting limits.

a Elevations are referenced to monitoring well MW1, with assumed datum of 100.00 feet.

b Elevations based on a survey conducted August 2002 and referenced benchmark with known elevation (NGVD 29) of 60.40 feet above mean sea level.

c Analysis not conducted due to broken sample containers.

d Hydrocarbon reported in the gasoline range does not match laboratory gasoline standard.

e Groundwater elevation in wells with LPH are corrected by multiplying the specific gravity of gasoline (0.69) by the LPH thickness and adding this value to the water elevation.

f Hydrocarbon reported is in the early diesel range, and does not match the laboratory diesel standard.

g Sample contained discrete peak in gasoline range and identified by lab as MTBE.

h Quantity of unknown hydrocarbon(s) in sample based on diesel.

i The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.

j Depth to groundwater is based on the depth of the stingers.

k Quantity of unknown hydrocarbon(s) in sample based on motor oil.

l Resurveyed Prior to 1st Quarter 2009 Measurements

m The well was not purged due to insufficient water.

n Groundwater elevation corrected by substituting the "product thickness" in the water column of the well with thickness of the groundwater equivalent, determined by multiplying the specific gravity of gasoline (0.739) by the "product thickness".

o Some hydrocarbons lower-boiling, some higher-boiling than diesel.

Laboratory Analytical Reports and Chain-of-Custody Documentation

Report Number : 89980

Date : 01/05/2015

Laboratory Results

Mehrdad Javaherian
LRM Consulting, Inc.
1534 Plaza Lane, #145
Burlingame, CA 94010

Subject : 12 Water Samples
Project Name : FORMER VAL STROUGH CHEVROLET
Project Number : TM STROUGH

Dear Mr. Javaherian,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the TNI 2009 standards.

Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Pace Analytical Services, Inc.

Pace Analytical Services, Inc. is certified by the State of California under the Environmental Laboratory Accreditation Program (ELAP), lab number 08263CA.

If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink that reads "Troy G. Turpen".

Troy Turpen

Report Number : 89980

Date : 01/05/2015

Subject : 12 Water Samples
Project Name : FORMER VAL STROUGH CHEVROLET
Project Number : TM STROUGH

Case Narrative

Repeat analysis of sample MW-5 by method M EPA 8015 yielded inconsistent results. The concentrations appear to vary between the bottles. The highest valid results are reported.

Recoveries for some Matrix Spike/ Matrix Spike Duplicate analytes were outside control limits. This may indicate a bias for the samples that were spiked. Since the LCS recoveries were within control limits, no data are flagged.

Samples MW4, MW5, and MW6 were centrifuged and decanted prior to extraction by EPA Modified Method 8015. This is a modification to standard procedure. Any hydrocarbons that were adsorbed to sediment or the original container surfaces were likely excluded.
