Phone Roger Hoffmore of USTCF to discuss site. We have been attempting to close the site and already have a closure package put together; however, judged that sampling of three downgradient residential water supply wells is appropriate given the concentration of MTBE detected in the onsite Ag well (1,200 ug/L) at one time. The work appears to be progressing as we have had calls from one of the owners who has been testing the well for 20 years for general chemistry, but uses well fairly limitedly. He is interested in having the well tested for COCs for the site. Presuming the concentrations may be ND or limited ACEH has been waiting for the data before finally proceeding. We had to sign off quickly as the USTCF was participating in the "Great Shakeout" in commemoration of the Loma Prieta quake, and preparation for the next. Roger said he would call back.
