**Subject:** RO167 - Transmittal of Draft Results  
**Attachments:** 2015 01 30\_Ltr\_to\_MDetterman\_ACEH.pdf

Mark,

Attached is the letter submitting the draft results for the most recent soil vapor sampling and downgradient grab groundwater sampling.

We look forward to discussing the next steps after you have had a chance to review.

I will also upload this to the ACEH htp site.

Regards,

Eva

Eva,  
Thanks for the update, and the extension request. It does appear appropriate with the bit of rain we're finally getting. Please use this email to document ACEH concurrence with the requested extension and date.

Dear Mr. Detterman,

Stantec Consulting Services Inc. (Stantec), on behalf of the David D. Bohannon Organization (Bohannon), is submitting to the Alameda County Health Care Services Agency (ACHCSA) draft tables and figures presenting data collected during recent investigations conducted at 575 Paseo Grande project in San Lorenzo, California (Site). The attached information is being submitted in draft form consistent with discussions during an August 2014 meeting between the ACHCSA, Bohannon, and Stantec. Specifically, during the meeting it was agreed that the attached draft information would be submitted and that subsequent discussions would be held to review the data and determine the appropriate next steps. Bohannon will be contacting you in the near future to request a date and time that is convenient for you to discuss the attached information.

The field work was conducted in accordance with the *August 29, 2014 Meeting Summary and Work Plan for Supplemental Investigation Activities (Work Plan)* which was submitted on September 23, 2014. The *Work Plan* was approved by the ACHCSA in an October 29, 2014 letter to Bohannon.

Because of rain events delaying the collection of soil vapor samples, Bohannon requested a six-week extension of the December 19, 2014 report submittal date included in the October 29, 2014 approval letter. The extension was approved which revised the submittal date for the attached draft tables and figures to January 30, 2015.

Grab groundwater sampling was conducted on October 15, 2014. Six soil vapor points (SV-15 to SV-19 and SV-18(D)) were installed on November 13, 2014 and soil vapor sample collection was conducted on January 6, 2015. Soil vapor samples were collected from four of the six vapor points; vapor points SV-15 and SV-18(D) could not be sampled due to the presence of water in the vapor point.

The attached draft tables present the results of the recent soil, grab groundwater, and soil vapor analyses as well as the historical groundwater analytical results. The attached draft figures present the most recent results for soil vapor and grab groundwater sampling as proposed in the above-referenced *Work Plan*. Key points of the investigation results are summarized below.

**Reference: Transmittal of DRAFT Tables and Figures Presenting Recent Investigation Data  
RO#167, 575 Paseo Grande, San Lorenzo, California**

- Petroleum hydrocarbons were not detected the grab groundwater samples collected at the three (3) locations down-gradient of the Site along Via del Sol (HP-14 to HP-16) (Table 6, Figure 2). These data, in conjunction with historic and recent results from wells MW-6 and MW-7, confirm that petroleum hydrocarbons in groundwater do not extend down-gradient from the Site to Via del Sol. No further investigation of down-gradient groundwater conditions is recommended.
- Total petroleum hydrocarbons measured as gasoline (TPHg) and benzene, toluene, ethylbenzene, and xylenes (BTEX) were not detected in the soil samples collected at a depth of 4.5 feet in each of the six soil vapor points installed in November 2014 (Table 5). These data confirm that shallow soil beneath Paseo Larga Vista is not affected by petroleum hydrocarbons at these sampling locations.
- No volatile organic compounds (VOCs) were detected in soil vapor samples from the two of the shallow soil vapor sample points (SV-17 and SV-19) installed beneath Paseo Larga Vista. Very low concentrations of a select number of VOCs were detected the remaining two soil vapor points (SV-16 and SV-18S). BTEX was not detected in either of these two samples.

As discussed during our August 2014 meeting, off-Site soil and groundwater impacts beneath Paseo Larga Vista are limited in extent and appear to be isolated beneath a confining silt-clay layer that extends from approximately 5 to 12 feet bgs across the majority of the on and off-Site investigation areas. These most recent shallow soil vapor data collected beneath Paseo Larga Vista suggest that the silt-clay layer likely provides a natural barrier that limits the potential for upward migration of hydrocarbons in vapor from the underlying soil and/or groundwater. There does not appear to be a complete pathway for migration of soil vapor from off-Site hydrocarbon impacted soil and/or groundwater to potential current or likely future receptors.

We look forward to discussing these results with you and discussing the appropriate next steps.

Regards,

**Notes and Abbreviations:**

Only detected analytes are included  
 ft. bgs = feet below ground surface  
 µg/m<sup>3</sup> = micrograms per cubic meter  
 % = percent  
**Bold** indicates detected concentration.

LTC = Low threat closure criteria (California Regional Water Quality Control Board)  
 J = Laboratory estimated value, between the method detection limit and the method quantifica  
 E = Exceeds instrument calibration range.  
 ND< = Analyte not detected above respective laboratory reporting limit.  
 --- = not applicable

**Abbreviations:**

mg/L = micrograms per liter  
MTBE = methyl tert-butyl ether  
TPH-G = Total Petroleum Hydrocarbons, Gasoline Range  
-- = water sample not analyzed for specified constituents  
DUP = Duplicate

**Notes:**

**Bold** indicates detected concentration.  
J = the chromatograph for this sample does not match the chromatographic pattern of the specified standard
