**Re: Petroleum Vapor Intrusion Risk Evaluation  
3093 Broadway Street  
Oakland, California  
Project No.: 731637001**

Dear Ms. Detterman,

On behalf of 3093 Broadway Holdings, L.L.C, Langan Treadwell Rollo (Langan) has prepared this Petroleum Vapor Intrusion (PVI) risk evaluation for the proposed development at 3093 Broadway in Oakland, California (the site; Figure 1). The approximately 3.4-acre site will be developed for mixed commercial and residential use. The two lowest levels of the development will consist of a commercial strip fronting Broadway and a two-story parking garage. Residential units will be developed on the third story and higher. The northern portion of the development will be constructed over an area where petroleum compounds have impacted the subsurface. The extent of the impacts has been defined, and cleanup activity is progressing. The residual petroleum compounds at the site will degrade over time; however, because residual petroleum compounds will remain in groundwater and soil vapor after construction, the Alameda County Department of Environmental Health (ACEH) requested this risk evaluation. This risk evaluation supersedes the future use risk screening presented in the Feasibility Study and Corrective Action Plan (FS/CAP; Langan, 2015), and incorporates the cumulative site data set, including additional data collected through August 2015, after preparation of the FS/CAP.

## RISK EVALUATION APPROACH AND DOCUMENT ORGANIZATION

The technical approach to the risk evaluation consists of the assessment of qualitative and quantitative factors that affect the fate and transport of subsurface vapors. Additional soil gas sampling conducted in August 2015 is described first. The subsequent section considers empirical information regarding plume stability, biodegradation, and vapor attenuation. The remainder of the document presents an analytical modeling assessment to evaluate the potential transport of volatile organic compounds (VOCs) to indoor air. The modeling results are then integrated with the qualitative assessment to develop an overall conclusion about risk. For this risk evaluation, maximum detected concentrations were used and conservative estimates of exposure were assumed. This approach was used with the intention of deriving a reasonable upper bound human health risk from PVI, based on the site data.

## SOIL GAS SAMPLING

Seven soil gas samples were collected, five of which were from soil gas well installations (SV-2, SV-4, SV-9, SV-10, SV-12) and two of which were from groundwater monitoring wells (MW-1 and MW-4). The soil gas well locations are shown on Figure 2. The soil gas samples were collected on 14 August 2015, except for the sample collected from well SV-10. Approximately 80 milliliters of water were encountered during purging of SV-10 during the first sampling attempt. Following the first sampling attempt, SV-10 was fully purged of water on August 19, 2015. During purging, a sample of the purged water was collected submitted for laboratory analysis for VOCs. No VOCs are detected; the analytical report is included in Attachment A. A soil gas sample was subsequently collected from SV-10 on 24 August 2015. No water was encountered at SV-10 on 24 August 2015.

The soil gas sampling locations and sample collection methods are summarized below and were described in Langan's Work Plan for Soil Gas Sampling, dated 4 September 2014, and in Langan's Addendum to Work Plan for Soil Gas Sampling dated 14 November, 2014. The soil gas samples were collected in general accordance with California Department of Toxic Substances Control (DTSC) approved methods (DTSC, 2015). The sampling and analysis plan was approved by the ACEH in its 7 August 2015 letter, sent via electronic mail.

### Soil Gas Sample Collection

Connections were made to existing semi-permanent soil gas well installations SV-2, SV-4, SV-9, SV-10 and SV-12. Soil gas samples were collected after withdrawing three purge volumes, according to DTSC guidelines, at 200 milliliters per minute (mL/min). Soil gas samples were collected into 1-Liter Summa canisters.

Connections were also made to groundwater monitoring wells MW-1 and MW-4 by pressing a tight-fitting PVC slip-cap with a drilled sample port onto the 2-inch well casing. A sealing compound was placed around the cap, at the junction with the well casing, to help prevent intrusion of ambient air into the well. The wells were purged of three casing volumes of air at a rate of 1 liter per minute (L/min). The applied vacuum was minimized and the water levels in the wells did not measurably rise as a result of vapor extraction. Soil gas samples were then collected, according to DTSC guidelines. Soil gas samples were collected into 1-Liter Summa canisters at 200 mL/min.

Helium was used as a tracer gas around the aforementioned boreholes during sampling as a quality assurance/quality control (QA/QC) measure to confirm sample integrity. A shut-in test and leak check were performed to ensure that no leaks were present in the laboratory provided sampling equipment. A detailed description of the sampling train assembly, shut-in test, leak check and sample collection methodology is provided in the Work Plan (Langan, 2014).

Ambient air samples were collected on 14 August 2015 and on 24 August 2015, and were analyzed as control samples. The ambient air samples were collected into 6-Liter summa canisters using 8-hour flow regulators. The summa canisters were placed on top of the steps

located south of the building, immediately west of the former air-sparge/dual-phase extraction treatment compound. Soil gas samples were transported under chain-of-custody procedures to Eurofins CalScience (CalScience), a State of California-certified laboratory for analysis.

### **Soil Gas Analytical Results**

The soil gas analytical results are presented in Tables 1 and 2. The laboratory analytical reports are included as Attachment A. The petroleum compound results from the sampling event conducted in August 2015 are generally consistent with the results from the November 2014 sampling event. Methane was detected in the soil gas samples from wells SV-2 and MW-1 at 1.3 percent and 0.59 percent, respectively. Groundwater is being monitored for methane production; however, groundwater cleanup is expected to reduce production of methane. Based on the methane concentrations detected in soil gas, methane is unlikely to accumulate at concentrations that would pose an explosion hazard within the future development.

### **VAPOR INTRUSION PATHWAY AND POTENTIAL RECEPTORS**

Residual petroleum compound concentrations in soil gas have the potential to migrate via seams and cracks in a foundation into an overlying structure. Petroleum compounds in groundwater are a potential source of petroleum compounds in soil gas. After construction, residents and commercial workers at the site could potentially be exposed to petroleum compounds by vapor intrusion and subsequent inhalation of indoor air.

### **CONCEPTUAL SITE MODEL**

The residual petroleum impacts to soil, groundwater and soil vapor at the site are described in the Conceptual Site Model (CSM; Langan, 2014). Additional site data collected from November 2014 through May 2015 is described in the 5 December 2014 letter regarding Additional Investigation Results, the FS/CAP, the 1 July 2015 Soil Investigation Report, and the 30 July 2015 Enhanced Bioremediation Pilot Study Report and Full Scale Implementation Plan. The following subsections describe the CSM, based on the cumulative data collected for the site.

### **Background Information**

Gasoline and diesel were released from leaking underground storage tanks (USTs). Although the three USTs were removed from the site in 1989, and cleanup activities were performed between 1989 and 2013, residual concentrations remain in soil, soil vapor, and groundwater. Natural attenuation is reducing residual petroleum concentrations at the site, and in May 2015, Broadway Holdings initiated enhanced bioremediation using gypsum emplacement to increase sulfate concentrations in source area groundwater, and thereby increase the biodegradation rate for petroleum compounds.

### **Plume Stability**

Residual petroleum impact to groundwater at the site is the primary source of petroleum compounds to soil gas. Plume stability is supported by the dominantly stable and decreasing trends of contaminant concentrations in site wells. To evaluate plume stability, two approaches were employed: 1) a qualitative approach, where graphs with Ordinary Least Squares

regression lines were prepared comparing petroleum compound concentrations for specific wells vs. time, and 2) a quantitative approach where Mann-Kendall statistical evaluations were conducted for benzene in impacted and downgradient wells. The results of these evaluations

indicate source well concentrations of benzene at MW-1 and MW-4 present statistically significant evidence of a decreasing trend at 95% confidence. Concentrations in downgradient wells (MW-7 and MW-8) rapidly decreased as the plume receded (Attachment B).

### **Biodegradation of Petroleum in Groundwater**

The depletion of electron acceptors (oxygen, sulfate and nitrate) and generation of metabolic byproducts (methane and ferrous iron) at groundwater monitoring wells MW-1 and MW-6 indicate active natural attenuation processes are occurring (Langan, 2015). The abundance of electron acceptors outside the residual source areas (e.g. cross-gradient wells MW-3 and MW-9) serves to restrict migration of petroleum compounds by degrading potential advances of the plume. Further, Broadway Holdings installed a network of gypsum columns in August 2015. Gypsum dissolves and releases sulfate over-time, which in turn acts to enhance biodegradation of petroleum compounds in groundwater.

### **Bioattenuation of Petroleum Compounds in Soil Gas**

Depth-to-groundwater at the site ranges from approximately 15 to 34 feet below ground surface. Site excavation for the redevelopment will reduce existing grade by approximately 0 to 18 feet. Post development, there will remain a sufficiently thick layer of soil between proposed future building foundations and the groundwater surface to permit biological processes: the vadose zone thickness beneath the foundation bottom is projected to range from approximately 8 to 10 feet in the area underlying the garage building (Langan, 2015). The vadose zone underlying the showroom is conservatively projected to be 10 to approximately 21 feet thick after construction (Langan 2015). This assumes a generalized foundation thickness of 5 feet; Langan understands that the development design includes column footings that will extend up to 4 feet below the future floor elevation, and that the non-structural portions of the floor slab will be less than 1 foot thick. Langan and previous site boring logs document underlying deposits as predominantly sandy and silty clay, and clayey sand with gravel (Langan, 2014). Sandy and silty clays result in attenuated vapor concentrations by limiting the rate of upward vapor migration away from a source (USEPA, 2002).

To evaluate the vertical concentration gradients at the site, soil vapor wells SV-2 and SV-12 were sampled concurrently with collection of deeper soil gas samples from nearby monitoring wells MW-1 and MW-4, respectively, in August 2015. Groundwater monitoring wells MW-1 and MW-4 are screened both below and above the water table, so vapor samples may be retrieved from the subsurface using the section of the well screen that is in the vadose zone. The approximate depth of samples collected from groundwater monitoring wells was calculated as the midpoint of the depth-to-water and the top of the screened interval. The length of the screened interval at MW-1 is from 19 to 35 feet bgs, and the May 2015 depth-to-water was 21.14 feet bgs, so the sample was collected from vapors entering the well through the approximately 2 feet thick interval between 19 and 21.14 feet bgs. The screened interval at MW-4 is from 15 to 30 feet bgs, and depth-to-water was 17.95 feet bgs during the May 2015

sampling event, so the sample was collected from vapors entering the well through the approximately 3 feet thick interval between 15 and 18 feet bgs. Location MW-1/SV-2 demonstrated attenuation on the order of 200X for benzene within a 4 feet vertical distance. Location MW-4/SV-12 exhibited a 2X attenuation of benzene and a 4X attenuation of ethylbenzene within a 4 feet vertical distance. The reduced attenuation factor for MW-4/SV-12 is likely attributable to low concentrations of PHC in both samples. The concentration gradients are presented as Attachment C. These results are consistent with the results obtained by Fischer et al., 1996; Lahvis et al., 1999; DeVaul, 2007; Davis, 2009; and Hartman, 2010, as summarized in the Technical Justification for Vapor Intrusion Media-Specific Criteria developed in support of the Low-Threat UST Closure Policy (LTCP) (SWRCB 2012).

## **Summary**

In summary, four lines of evidence were applied to assess the vapor intrusion pathway:

- Plume stability
- The presence of an aerobic biodegradation zone
- Site-specific soil properties
- Soil gas data and vertical concentration gradients

Each component qualitatively and semi-quantitatively supports the conclusion that vapor intrusion is not a pathway of concern for future receptors following redevelopment.

## **VAPOR INTRUSION MODELING**

To quantitatively evaluate vapor intrusion into indoor air, the American Petroleum Institute (API) BioVapor Model (API 2010, version 2.1) was used. BioVapor is a steady-state, 1-dimensional spreadsheet that incorporates first-order aerobic biodegradation with the heuristic vapor intrusion model developed by Johnson and Ettinger (J&E). The model was used to assess risk attributable PVI from groundwater throughout the site (Attachment D). The J&E SG-SCREEN model was used to evaluate 1,2-dichloroethane (1,2-DCA), a non-PHC VOC. The United States Environmental Protection Agency (EPA) endorses computer modeling of PVI using BioVapor and J&E (USEPA 2015). Further, EPA's PVIScreen assessment tool utilizes the BioVapor equations recoded in Java.

Key input parameters for biodegradation and vapor intrusion modeling include building parameters, vadose zone properties, and source zone parameters. Default residential and non-residential building parameters were used in the BioVapor and J&E models, with the exception of the residential indoor mixing height ( $H_b$ ). A site-specific residential mixing height (366 cm) was utilized to account for residential exposure on the second floor of a multi-story building (USEPA 2002). This represents a conservative approach given that residential units are not planned below the third floor. Site-specific values for soil porosity ( $0.385 \text{ cm}^3\text{-void/cm}^3\text{-soil}$ ), soil water content ( $0.197 \text{ cm}^3\text{-water/cm}^3\text{-soil}$ ), and dry bulk density ( $1.63 \text{ g/cm}^3$ ) were selected from the J&E default values for sandy clay. Modeled constituent concentrations and groundwater depths corresponded to maximum concentrations of risk drivers at shallow depths subsequent to site-grading.

Petroleum compounds in groundwater that could potentially volatilize and migrate to indoor air include benzene, toluene, ethylbenzene, xylenes (BTEX), 1,2-DCA, and naphthalene (Langan 2015). Based on the groundwater results from 2013 through 2015, wells MW-1 and MW-16B were selected for modeling because they represent locations with maximum contaminant concentrations for the upper plume underlying the future parking garage (Langan, 2015). Similarly, groundwater data from wells MW-4 and MW-10 were selected to evaluate PVI at the lower plume beneath the showroom because these locations have the highest detected BTEX and gasoline range Total Petroleum Hydrocarbon concentrations (Langan 2015). The post-development depth-to-water for each location was conservatively estimated to be 9 feet bgs. This represents the 90<sup>th</sup> percentile of the projected post-construction depth-to-groundwater distribution, which is expected to range from 7 to 16 feet beneath the future foundation bottom of the parking garage and 12 to 22 feet beneath the future foundation bottom of the commercial strip. For the soil gas J&E models associated with the evaluation of 1,2-DCA, the sample depth was set to 6 feet bgs.

The development design is presented in the drawings prepared by Van Tilburg, Babvard & Soderbergh, AIA, dated 2 March 2015. The locations of stairwells, elevator shafts, or other such deeper building features will be reviewed during construction, as described in the Construction Soil and Groundwater Management Plan (CSGMP; Langan, 2015). According to the CSGMP, if a deeper building feature will be located within or near the areas with residual petroleum impacts, the potential for the feature to act as a preferential pathway will be evaluated, and if necessary, the soil thickness assumptions in this risk evaluation will be updated accordingly.

The San Francisco Bay Regional Water Quality Control Board default exposure parameters used to derive the Environmental Screening Levels (SFBRWQCB, 2013) for residential and commercial exposures were utilized in the receptor-specific models, with the exception of the residential exposure duration (ED). The residential ED was set to 26 years consistent with the value recommended by the California Department of Toxic Substances Control (DTSC) and the EPA's Exposure Factors Update (DTSC, 2014). The following toxicity values were applied in the BioVapor and J&E models:

### Toxicity Criteria

Compound	Inhalation Slope Factor (mg/kg-day) <sup>-1</sup>	Source	Reference Concentration (mg/m <sup>3</sup> )	Source
Benzene	0.1 <sup>1</sup>	OEHHA	0.03 <sup>1</sup>	IRIS
Ethylbenzene	0.0087 <sup>2</sup>	OEHHA	1.0 <sup>1</sup>	IRIS
Naphthalene	0.12 <sup>2</sup>	OEHHA	0.003 <sup>1</sup>	IRIS
Toluene	--	--	0.3 <sup>1</sup>	OEHHA
Xylenes	--	--	0.1 <sup>1</sup>	IRIS
Compound	Inhalation Unit Risk ( $\mu\text{g}/\text{m}^3$ ) <sup>-1</sup>	Source	Reference Concentration (mg/m <sup>3</sup> )	Source
1,2-DCA	2.6E-05 <sup>3</sup>	IRIS	0.007 <sup>3</sup>	PPRTV

Notes: 1 – Value used to develop ESLs (ESL Table J-2)

2 – OEHHA Criteria for Inhalation

3 – Value recommended by DTSC

OEHHA = Office of Environmental Health Hazard Assessment

IRIS = Integrated Risk Information System

PPRTV = EPA Provisionally Peer Reviewed Toxicity Values

Cancer risk estimates were compared to an acceptable cumulative risk threshold of 1E-06 for multiple chemicals and a single-chemical target risk of 1E-06. This represents an incremental increase of 1 in 1,000,000 in the chance of developing cancer over a lifetime. Systemic hazards were compared to a hazard quotient of 1 for single chemicals and an unsegregated hazard index of 1 for multiple chemicals (Attachment D). If the site-specific exposure level exceeds the effects-based threshold (i.e. the hazard index exceeds 1), there may be concern for potential non-carcinogenic effects.

Results of the BioVapor and J&E models indicate acceptable cumulative excess cancer risk and hazard indices at each modeled location for residential and commercial receptors. The individual hazard quotients and HIs associated with the vapor intrusion pathway do not exceed the threshold level of 1. Individual excess cancer risks and cumulative cancer risk estimates associated with indoor air inhalation are below the target risk of 1E-06. The following table summarizes the results of the BioVapor and J&E models for each location:

### Risk Characterization

Location	Model	Cumulative Cancer Risk	Hazard Index	Acceptable
SV-10	J&E Residential	9E-07	1E-02	Yes
MW-1	BioVapor Residential	6E-11	3E-07	Yes
MW-4	BioVapor Residential	5E-07	3E-03	Yes
MW-10	BioVapor Residential	8E-09	5E-05	Yes
MW-16B	BioVapor Residential	2E-17	8E-14	Yes
SV-10	J&E Commercial	1E-07	1.6E-03	Yes
MW-1	BioVapor Commercial	2E-11	1E-07	Yes
MW-4	BioVapor Commercial	2E-07	1E-03	Yes
MW-10	BioVapor Commercial	3E-09	2E-05	Yes
MW-16B	BioVapor Commercial	8E-18	3E-14	Yes

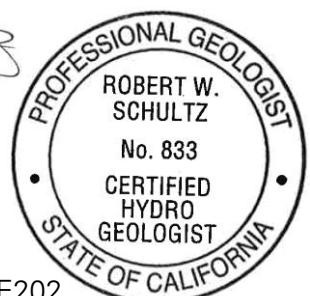

### SUMMARY AND CONCLUSIONS

The objectives of the PVI risk evaluation were to determine whether concentrations of site-related constituents in groundwater and soil vapor pose unacceptable risks to human health under site-specific exposure conditions, and to provide information to support decisions concerning the need for mitigation based on future land use. Langan concludes that residual hydrocarbons in soil vapor and groundwater beneath the site do not pose an unacceptable carcinogenic risk or non-carcinogenic hazard by potential PVI to future residents or commercial workers at the proposed development.

Sincerely,

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

## Work Order Narrative

---

Work Order: 15-08-1204

Page 1 of 1

---

### **Condition Upon Receipt:**

Samples were received under Chain-of-Custody (COC) on 08/18/15. They were assigned to Work Order 15-08-1204.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

### **Holding Times:**

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

### **Quality Control:**

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

### **Subcontractor Information:**

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

### **Additional Comments:**

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

## Detections Summary

Client: Treadwell & Rollo - A Langan Company  
 555 Montgomery St., Suite 1300  
 San Francisco, CA 94111-2554

Work Order: 15-08-1204  
 Project Name: 3093 Broadway / 731637001  
 Received: 08/18/15

Attn: Christina Rain

## Glossary of Terms and Qualifiers

Work Order: 15-08-1204

Page 1 of 1

<b>Qualifiers</b>	<b>Definition</b>
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
	Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.
	A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

## Work Order Narrative

---

Work Order: 15-08-1684

Page 1 of 1

---

### **Condition Upon Receipt:**

Samples were received under Chain-of-Custody (COC) on 08/25/15. They were assigned to Work Order 15-08-1684.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

### **Holding Times:**

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

### **Quality Control:**

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

### **Subcontractor Information:**

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

### **Additional Comments:**

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Page 1 of 1

<b>Qualifiers</b>	<b>Definition</b>
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
	Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.
	A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Analytical Report reviewed & approved for release on 08/20/2015 by:

Angela Rydelius,  
Laboratory Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory.  
The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Treadwell & Rollo  
**Project:** 731637001; 3093 Broadway  
**WorkOrder:** 1508655

### Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Chemical Name	Target Hazard Quotient ( <sup>-1</sup> )	Target Cancer Risk ( <sup>-1</sup> )	Target Indoor Air Concentration ug/m <sup>3</sup> -air	Soil Gas Source Concentration ug/m <sup>3</sup>	Effective Saturated Vapor Concentration ug/m <sup>3</sup>	Groundwater Source Concentration ug/L	Effective Solubility ug/L
benzene	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected
ethylbenzene	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected
toluene	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected
xylanes (mixed isomers)	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected
naphthalene	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected	Not Selected

**NOTE B:** Target indoor air concentrations can be edited on the "Chemical Database" screen

**NOTE C:** Red value indicates source concentration greater than saturation limit

**NOTE D:** Backward Risk Calculation not applicable when aerobic depth directly specified

**NOTE E:** Backward Calculation not completed due to Excel calculation error
