Subject: Dewatering Volume Estimate during construction

Hi Barbara,

Per your request for the site at 5812 Hollis Street, Emeryville, I calculated the volume to be pumped out at the site during construction dewatering to be approximately 2 million gallons. This is based on continuous pumping at a 5 gpm flow rate for a 9 month duration.

Feel free to contact me if you have any questions or comments.

Thanks.

Matthew B. Hall, PE
