11/7/96

Terry Fox (Ultramon) called today to inform me of the SUE/sparge/PIT system "start-up" status. He indicated there's been some delay caused by difficulty in getting a PGIE hook-up, and some other hardware problems.

We also noted the marked decrease (9600-64776) in benzene concentrations in amw-4 between 3/96 and 6/96. He said he'd look at the data, but assumes that it is just a "bad" data pt. We'll keep watch on future sample results.

MEMO to file:

Terry Fox (Ultramar) and I spoke today regarding the SVE/ sparging system status. He said he already did the "job walk" with FUGRO, and that they are finalizing requirements from the city's planning and building depts. Buildout and startup should be by year's end.

MEMO to file:

Terry Fox (Ultramar) called re: SVE system construction. This call followed mine, following review of the 3/22/95 Acton-Mickelson-van Dam, Inc. well installation report. This report includes both SVE and air sparge well installation discussions. Mr. Fox indicates consultants were changed 4/1/95 for this site, and that the new firm is supposed to be "...in the design phase" now. He doesn't know the expected schedule.

MEMO to file:

I spoke w/ Terry Fox (Ultramar) today re: the results of the case review I conducted last week. ~~we discussed my desire for one or two wells~~ SW and west of the site. I expressed that, w/o such data pts., the ability to gauge ~~what~~ the effectiveness of whatever CAP is employed here will be impossible. Further, the hydro punch study conducted by EGC, memorialized in the 3/13/92 EGC report, clearly identifies that contaminants have significantly migrated off-site. GW contaminant isopleths do not reflect this in subsequent reports. He will try to get back to us re: this issue by next week sometime. I also mentioned need for reports generated between 6/87 and 11/88, particularly that documenting soil borings advanced near the well MW-5.

He indicated a SVE / sparge / pump test was performed during 4th qtr. 1993. The results are not yet available.
