Subject: **Quarterly Report - Fourth Quarter 2007**
RINEHART OIL, INC. - OAKLAND TRUCK STOP
1107 5th Street, Oakland, California

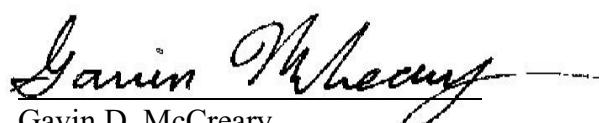

Dear Mr. Wickham:

At the request of Mr. Reed Rinehart of RinoPacific, Inc., *Advanced GeoEnvironmental, Inc.* has prepared the enclosed *Quarterly Report - Fourth Quarter 2007* for the above-referenced site. The scope of work included monitoring of the on-site ozone sparge remediation system, performance of the October 2007 ground water monitoring event, submission of monitoring and analytical data to the State Water Resources Control Board's GeoTracker information management system, and preparation of this report.

If you have any questions or require further information, please contact our office at (707) 570-1418.

Sincerely,

Advanced GeoEnvironmental, Inc.

Gavin D. McCreary
Staff Scientist

1.0. INTRODUCTION

At the request of Mr. Reed Rinehart of Rinehart Oil Inc., *Advanced GeoEnvironmental, Inc.* (AGE) has prepared this *Quarterly Report - Fourth Quarter 2007* for the site located at 1107 5th Street, Oakland, California. This report presents the procedures and results of the October 2007 ground water monitoring event and a summary of the monitoring activities in relation to the in-situ chemical oxidation (ozone sparge) remediation systems located on-site. The site and surrounding area are illustrated on Figure 1; on-site structures, soil borings, and well locations are illustrated on Figure 2. Site background information is provided in Appendix A.

The goals of the ground water monitoring program are to assess site ground water for seasonal variation of elevation, gradient, and flow direction, and to assess the impact of petroleum hydrocarbon compounds and fuel oxygenating compounds in shallow ground water beneath the site. This report has been prepared in accordance with the Regional Water Quality Control Board's *Appendix A - Reports, Tri-Regional Board Staff Recommendations for Preliminary Investigation and Evaluation of Underground Tank Sites*.

2.0. GROUND WATER MONITORING AND SAMPLING

On 25 October 2007, the fourth quarter 2007 ground water monitoring event was conducted at the site. Following the guidelines for the Ground Water Monitoring Program, this sampling round included the measurement of ground water levels and collection of ground water samples from each of the site related monitoring wells MW-1, MW-3N, and MW-4 through MW-16 (Figure 2). Ground water sampling procedures and protocols implemented at the site are presented in Appendix B. The ground water monitoring program for the site is presented below:

- Quarterly monitoring of ground water levels, and ground water sample collection and analysis for wells MW-1, MW-3N, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, MW-13, MW-14, MW-15, and MW-16.

Measurements of depth to ground water were obtained prior to purging and sampling of the ground water monitoring wells at the site. During well purging procedures, ground water parameters including temperature, pH, and conductivity were routinely measured until purge water parameters stabilized to ensure the presence of ground water representative of the formation. Between 3 and 8 gallons of water (three casing-water volumes) was purged from monitoring wells MW-1, MW-3N, and MW-4 through MW-14. Wells MW-15 and MW-16 were each purged of 23 gallons of water. Ground water sampling field data and logs are presented in Appendix C. The purged water was stored on-site in properly labeled, Department of Transportation (DOT)-approved 55-gallon drums.

Following sample collection, each ground water sample was labeled, logged on a chain-of-custody form, and placed in a chilled container for storage and transportation to an analytical laboratory. Ground water samples were submitted for analysis to Cal Tech Environmental Laboratories (CTEL), a California Department of Public Health (CDPH)-certified analytical laboratory, for analysis. The samples were analyzed for:

- Total petroleum hydrocarbons quantified as gasoline and diesel (TPH-g and TPH-d, respectively), in accordance with EPA Method 8015M; and
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX), and fuel oxygenating compounds di-isopropyl ether (DIPE), ethyl tertiary-butyl ether (ETBE), methyl tertiary-butyl ether (MTBE), tertiary-amyl methyl ether (TAME), and tertiary-butyl alcohol (TBA) and lead scavengers 1,2-dibromoethane (EDB), and 1,2-dichloroethane (1,2-DCA), in accordance with EPA Method 8260B.

Chain-of-custody protocols were used to document sample custody transfers from the field to the analytical laboratory. The CTEL report No. CT214-0708179, which documents the ground water analyses, test methods, laboratory quality assurance/quality control (QA/QC) reports, and chain-of-custody forms, is provided in Appendix D. The GeoTracker confirmation number of the submitted laboratory electronic deliverable format (EDF) file is #4618592858. Ground water analytical results are presented in Section 3.2.

3.0. FINDINGS

The ground water elevation and flow direction at the site were determined from field data; a summary of depth to ground water measurements is presented in Table 1. The hydrocarbon-impact to ground water was quantified by laboratory analysis of the ground water samples; a summary of analytical results is presented in Table 2. A summary of the geochemical parameter measurements and the ozone system operation and maintenance activities are presented in Table 3 and Table 4, respectively.

3.1. GROUND WATER FLOW DIRECTION AND GRADIENT

Depth to ground water was measured between 2.23 feet (MW-10) and 6.55 feet (MW-7) below the well heads. Ground water elevation at the site ranged from 4.85 feet (MW-16) to 7.19 feet (MW-10) above mean sea level (MSL). The average measured ground water elevation was approximately 5.77 feet above MSL, an increase of 0.35 feet since the previous monitoring event conducted in August 2007. The GeoTracker confirmation number of the submitted depth to water electronic

deliverable format data (EDD) file is No. 3377669394.

During the monitoring event, the potentiometric surface at the site is shown as a northeast-trending ridge centered over wells MW-10 and MW-3N, and extended towards MW-14. Ground water was inferred to be generally flowing toward the north and towards the northeast under a hydraulic gradient of 0.01 foot per foot (ft/ft). Depth to water and ground water elevations are summarized in Table 1. Figure 3 illustrates the contoured ground water elevations as measured on 25 October 2007.

3.2. GROUND WATER ANALYTICAL RESULTS

The analytical results for ground water samples collected from on-site monitoring wells MW-1, MW-3N, and MW-4 through MW-16 are as follows:

TPH-g was detected in seven of the 15 ground water samples collected, at concentrations ranging from 110 micrograms per liter ($\mu\text{g/l}$) to 41,000 $\mu\text{g/l}$ in wells MW-11 and MW-7, respectively. TPH-d was detected in four of the 13 samples, at concentrations ranging from 4,200 $\mu\text{g/l}$ to 300,000 $\mu\text{g/l}$ in wells MW-6 and MW-5, respectively. Figures 4 and 5 illustrate the estimated distributions of dissolved TPH-g and TPH-d at the site.

BTEX constituents were detected in three of the 15 ground water samples collected for analysis. Benzene, toluene, and ethyl-benzene were detected at reported concentrations of 3,800 $\mu\text{g/l}$, 53 $\mu\text{g/l}$, and 380 $\mu\text{g/l}$, respectively, in sample MW-7 (Table 2). Total xylenes were detected in wells MW-4, MW-8, and MW-7 at concentrations of 1.6 $\mu\text{g/l}$, 3.6 $\mu\text{g/l}$, and 1,521 $\mu\text{g/l}$, respectively.

MTBE was detected in six of the 15 samples collected from the site related wells, at concentrations ranging from 7.2 $\mu\text{g/l}$ (MW-8) to 1,300 $\mu\text{g/l}$ (MW-7). TAME and 1,2-DCA were detected in well MW-7 at concentrations of 18 $\mu\text{g/l}$ and 62 $\mu\text{g/l}$, respectively. Figure 6 illustrates the estimated distribution of dissolved MTBE at the site.

A summary of ground water analytical results is presented in Table 2. The CTEL report No. CT214-0710220, which documents the ground water analyses, test methods, laboratory QA/QC reports, and chain-of-custody forms, is provided in Appendix D. The GeoTracker confirmation number of the submitted laboratory EDF file is #4618592858.

3.3. OZONE SPARGING REMEDIATION

In-situ chemical oxidation (ozone injection) operation began at the site on 24 September 2005. The two (North Unit and South Unit) ozone systems currently inject ozone, for a duration of 1-hour, into

two ozone injection points at a time.

For the North Unit a total of ten ozone injection wells have been on-line throughout the fourth quarter 2007. The North Unit was shut down from March to July 2007 due to the destruction of ozone wells OZ6, OZ7, OZ10, OZ16, and OZ17. On 27 July 2007, subsequent to re-plumbing the recently replaced ozone sparge points, the North Unit was reactivated. For the South Unit, a total of ten ozone injection points were on-line throughout the fourth quarter 2007.

Summaries of the ozone system geochemical parameters measured from site related monitoring wells, and the operational parameters and maintenance activities through the third quarter 2007 are included in Tables 3 and 4, respectively.

4.0. SUMMARY AND CONCLUSIONS

- Depth to ground water was measured between 2.23 feet (MW-10) and 6.55 feet (MW-7) below the well heads. Ground water elevation at the site ranged from 4.85 feet (MW-16) to 7.19 feet (MW-10) above MSL. During the fourth quarter 2007 monitoring event, the potentiometric surface at the site is shown as a northeast-trending ridge centered over wells MW-10 and MW-3N, and extended towards MW-14. Ground water was flowing north and northeast (0.01 ft/ft). This flow pattern is consistent with those observed during previous monitoring events.
- TPH-g was detected in seven of the 15 ground water samples collected, at concentrations ranging from 110 µg/l to 41,000 µg/l in wells MW-11 and MW-7, respectively. As shown on Figure 4, the highest concentrations of TPH-g appear to be in the central portion of the site, in the vicinity of wells MW-5 and MW-8, and on the northwestern portion of the site, in the vicinity of MW-7. TPH-d was detected in four of the 15 samples at concentrations ranging from 4,200 micrograms per liter (µg/l) to 300,000 µg/l in wells MW-6 and MW-7, respectively. As shown on Figure 5, the highest concentrations of TPH-d appear to be in the central portion of the site, in the vicinity of wells MW-5 and MW-8, and on the northwestern portion of the site, in the vicinity of MW-7.
- BTEX constituents were detected in three of the 15 ground water samples collected for analysis. Benzene, toluene, and ethyl-benzene were detected at reported concentrations of 3,800 µg/l, 53 µg/l, and 380 µg/l, respectively, in sample MW-7 (Table 2). Total xylenes were detected in wells MW-4, MW-8, and MW-7, at concentrations of 1.6 µg/l, 3.6 µg/l, and 1,521 µg/l, respectively.
- MTBE was detected in six of the 13 samples collected from the site related wells at concentrations ranging from 7.2 µg/l (MW-8) to 1,300 µg/l (MW-7). TAME and 1,2-DCA were detected in well MW-7 at concentrations of 18 µg/l and 62 µg/l, respectively. Figure 6

illustrates the estimated distribution of dissolved MTBE at the site.

- For the Northern Ozone Unit, a total of ten ozone injection wells have been on-line throughout the Fourth Quarter 2007. On 27 July 2007, subsequent to re-plumbing the recently replaced ozone sparge points, the North Unit was reactivated. For the South Unit, a total of ten ozone injection points were on-line throughout the Fourth Quarter 2007. As shown on Figures 7 and 8, the concentrations of TPH-g and TPH-d in the majority of the wells has decreased subsequent to activating the ozone injection systems. However, the concentrations of TPH-g and TPH-d in well MW-5 have exhibited a slight increasing trend over the past two quarters of monitoring. As shown in Figures 9 and 10, the concentrations of benzene and MTBE in ground water have decreased overall during the monitoring program, and have decreased significantly since the activation of the ozone injection systems. Although the concentrations of benzene and MTBE have appeared to fluctuate more than the other contaminants of concern from quarter to quarter, the overall trend is still decreasing.

5.0. RECOMMENDATIONS

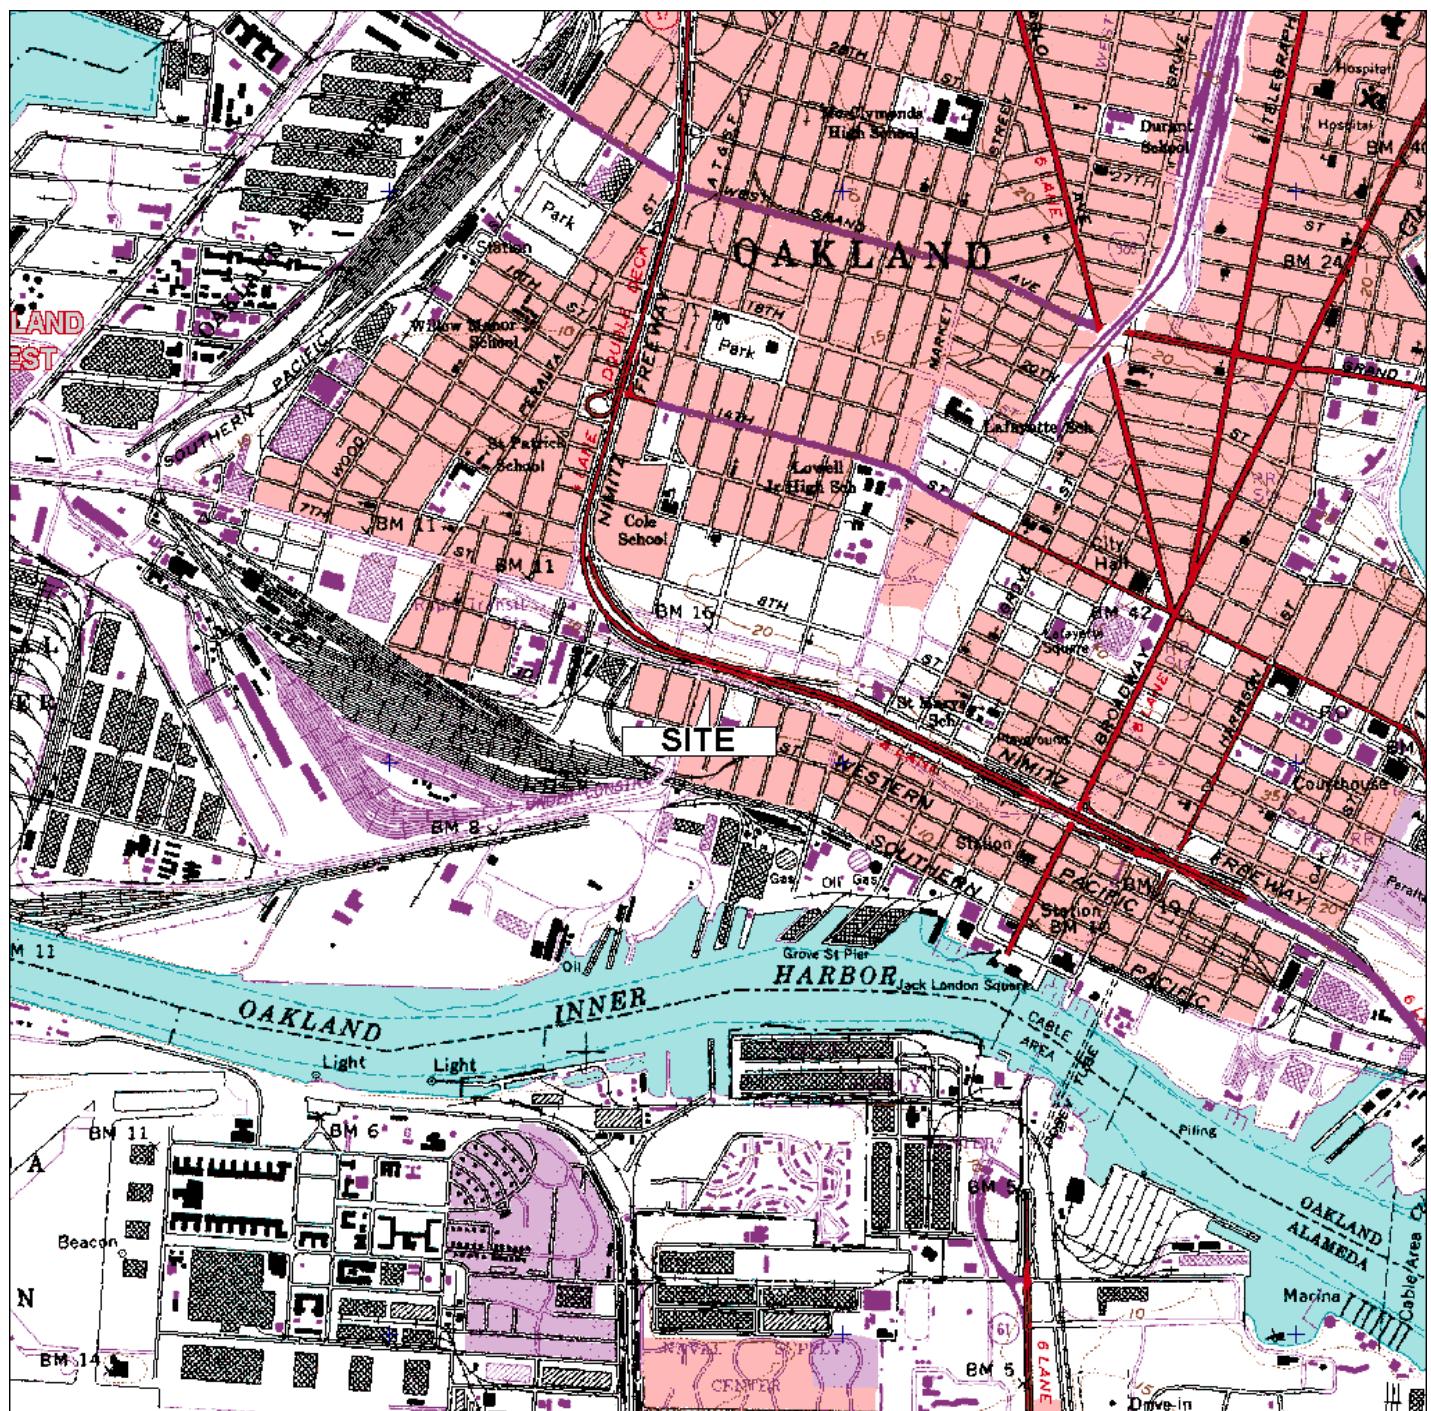

Based upon data reviewed and collected at the site, AGE recommends:

- Continued quarterly ground water monitoring; the first quarter 2008 ground water monitoring event was performed in January 2008 and the report is forthcoming.
- Continuation of *in-situ* chemical oxidation (ozone injection) remediation.

6.0. LIMITATIONS

Our professional services were performed using that degree of care and skill ordinarily exercised by environmental consultants practicing in this or similar localities. The findings were based upon field measurements and analytical results provided by an independent laboratory. Evaluations of the hydrogeologic conditions at the site for the purpose of this investigation are made from a limited number of available data points (i.e. ground water samples) and subsurface conditions may vary away from these data points. No other warranty, expressed or implied, is made as to the professional interpretations, opinions and recommendations contained in this report.

APPENDIX A

Appendix A - Historical Background

Rinehart Oil, Inc - Oakland Truck Stop
1107 5th Street, Oakland, California

A.1. BACKGROUND

The site is located at 1107 5th Street in a commercial and industrial area of west Oakland, California (Figure 1). The property contains a service station building, four fuel dispenser islands, a truck scale, scale house, and two underground storage tanks (USTs). The site has been operating as a truck stop for the past 40 years.

A.2. REGIONAL GEOLOGIC/HYDROGEOLOGIC SETTING

The site is situated within the Coast Range Geomorphic Province of California. This geomorphic province contains coastal foothills and mountains and extends from the Tehachapi Mountains in the south to the Klamath Mountains in the north. The western and eastern boundaries of this province are comprised of the Pacific Ocean and the Great Valley Geomorphic Province, respectively.

The site is located in the Franciscan Complex, which is subdivided into four major divisions identified as the Northern Coast Range, the Franciscan Block, the Diablo Range, and the Nacimiento Block. The site is situated within the Franciscan Block, an assemblage of variably deformed and metamorphosed rock units. The surface is composed of Quaternary alluvium; at depth, the site is underlain by rocks of the Franciscan Complex, which are composed predominately of detrital sedimentary rocks with volcanic tuffs and deep ocean marine sediments. The Franciscan lithologies typically have low porosity and permeability.

Based upon the General Soil Map from the *Soil Survey of Alameda County, Western Part*, issued by the United States Department of Agriculture Soil Conservation Service in 1981, the site area is situated within the Urban Land-Danville complex. This complex is located on low terraces and alluvial fans at an elevation of about 20 feet to 300 feet above mean sea level (MSL), and consists of approximately 60% Urban Land, 30% Danville soil, and 10% other soils. Danville soil is a silty clay loam that formed in alluvium originating primarily from sedimentary rock; Urban land consists of areas covered by roads, parking lots, and buildings. The nearest surface water feature in the vicinity of the property is the Oakland Estuary, approximately 2,400 feet to the south of the property.

Beginning in October 1996, ground water monitoring has been conducted at the site to assess the seasonal variation of elevation, gradient, and flow direction, and to define the impact of petroleum hydrocarbon compounds and fuel oxygenating compounds in shallow ground water beneath the site. Based on data from previous monitoring events, ground water at the property varies seasonally between approximately 10 inches to 6 feet below surface grade (bsg). The ground water flow has varied from southwest to north. This may be affected by changing recharge and discharge patterns, as well as leaking pipes.

A.3. UNDERGROUND STORAGE TANK REMOVAL

In March 1999, two 10,000-gallon diesel USTs, one 10,000-gallon gasoline UST, and one 8,000-gallon gasoline UST were removed from the site. The approximate location of the former USTs is shown on Figure 2.

Interim remedial action was performed during the UST removal to address contaminated soil and ground water. Approximately 2,100 tons of contaminated soil were removed from the excavation. Soil samples were collected from the excavation and stockpiles as directed by the Fire Inspector. Contaminated ground water was removed from the excavation pit; approximately 33,000 gallons of water were pumped into temporary storage tanks, which were then transported and disposed off-site. Approximately 1,700 tons of backfill was placed in the excavation. Results of the soil samples taken during the excavation are not available.

A.4. PREVIOUS SITE ASSESSMENT ACTIVITIES

In November 1996, ground water monitoring wells MW-1 through MW-3 were installed to a depth of 20 feet bsg to assess contamination from an unauthorized release of fuel, which was repaired as soon as it was discovered. Product recovery sumps equipped with skimmers were installed in the wells and approximately 6 gallons of gasoline were recovered.

Monitoring well MW-2 was destroyed in January 1999. Additional monitoring wells MW-4 through MW-9 were installed to a total depth of 20 feet bsg in August 2000. Contamination was detected in each of the wells, and free product was occasionally evident in well MW-7.

Monitoring wells MW-10 and MW-11 were installed in May 2002 to a total depth of 12 feet bsg. At this time, well MW-3 was abandoned and well MW-3N was installed to a depth of 12 feet bsg.

In July 2002, eight soil borings were advanced on 5th Street and Chestnut Street to total depths between 5 feet and 8 feet bsg to determine if contamination was migrating off-site along preferential pathways (i.e. utility trenches). Sample results indicated high methyl tertiary-butyl ether (MTBE) concentrations that ranged from 170,000 micrograms per liter ($\mu\text{g/l}$) to 460,000 $\mu\text{g/l}$ in grab ground water samples from borings drilled directly north of the site, along the 5th Street sewer line. Borings east of the site had little to no contamination.

In January 2003, a passive skimmer was placed inside monitoring well MW-7 to remove free product. During monitoring activities in April 2004, free-product was noted in MW-8. The passive skimmer in MW-7 was moved to MW-8 to remove the free product.

Site Background Information: Rinehart Oil, Inc. - Oakland Truck Stop
Page 3 of 4

On 04 and 05 October 2004, a total of thirteen soil borings were advanced at the site. Boring MW14 and the ten ozone sparge well borings were advanced at the north edge of the property to vertical depths of 20 feet and 15 feet below surface grade (bsg), respectively. Borings MW12 and MW13 were advanced in the 5th Street right of way to the north of the property to a vertical depth of 20 feet bsg. Pilot borings MW12 through MW14 were completed as ground water monitoring wells using 2-inch diameter polyvinylchloride (PVC) casing with a 0.020-inch slotted screen installed from 5 feet to 20 feet bsg. The ozone sparge well soil borings were completed with manufacturer-assembled, 2-inch by 24-inch microporous sparge points and blank casing extended to the surface, with a filter pack (No. 2/12 Lonestar sand) installed from 9 feet to 13 feet bsg. A total of three soil samples, taken from the monitoring well pilot borings, were analyzed for petroleum hydrocarbon constituents. In sample MW14-10, 1.8 milligrams per kilogram (mg/kg) TPH-d and 2.0 mg/kg MTBE were detected.

On 05, 06, and 07 July 2006, five soil borings were advanced on-site to a depth of 40 feet below surface grade (bsg) utilizing a CME-75 HT truck-mounted drill rig. On 18 July 2006, two additional soil borings were advanced on-site near the Adeline Street utility corridor to 20 feet bsg utilizing a van-mounted Geoprobe 5400 direct-push probing unit. All borings were continuously cored from surface grade to total depth. Soil and grab ground water samples were collected at selected intervals based on lithology encountered during drilling; grab ground water samples were collected from borings advanced immediately adjacent to P1 through P5, and at total depth in borings P6 and P7. Soil samples were collected between depths of 6 feet and 40 feet bsg from borings P1 through P7 and analyzed for petroleum hydrocarbon constituents. TPH-g was detected in soil samples P1-6, P1-21, P2-8, and P4-7 at concentrations of 210 mg/kg, 2.6 mg/kg, 110 mg/kg, and 10 mg/kg, respectively. TPH-d was detected in samples P1-6, P2-8, and P4-7 at concentrations of 7,600 mg/kg, 680 mg/kg, and 13,000 mg/kg, respectively.

Grab ground water samples were collected from soil borings advanced immediately adjacent to P1 through P5 at selected sandy zones between 10 feet and 35 feet bsg, and from borings P6 and P7 at a depth of 20 feet bsg. TPH-g was detected in boring P1 at 20 feet and 35 feet bsg, in boring P4 at 10 feet bsg, in boring P5 at 10 feet and 35 feet bsg, and in borings P6 and P7 at 20 feet bsg at concentrations ranging from 130 µg/l (P6-20-W) to 38,000 µg/l (P4-W-10). TPH-d was detected in boring P1 at 20 feet and 35 feet bsg, in boring P4 at 10 feet bsg, and in boring P7 at 20 feet bsg at concentrations ranging from 4,500 µg/l (P1-W-35) to 350,000 µg/l (P4-W-10). BTEX constituents were detected in boring P1 at 20 feet and 35 feet bsg, P5 at 10 feet and 35 feet bsg, and P6 at 20 feet bsg at maximum concentrations of 110 µg/l benzene (P1-W-20), 36 µg/l toluene (P5-W-10), 13 µg/l ethylbenzene (P1-W-35), and 17.3 µg/l total xylenes (P1-W-20). MTBE was detected in samples collected from boring P1 at 20 feet and 35 feet bsg, in boring P4 at 10 feet bsg, in boring P5 at 10 feet and 35 feet bsg, and in borings P6 and P7 at 20 feet bsg at concentrations ranging from 4.1 µg/l (P6-20-W) to 11,000 µg/l (P1-W-20). TAME was detected in boring P1 at 20 feet and 35 feet bsg, in boring P4 at 10 feet bsg, and in boring P5 at 10 feet bsg at concentrations ranging from 3.4 µg/l (P5-W-10) to 17 µg/l (P1-W-20). The lead scavenger 1,2-DCA was detected in boring

P1 at 20 feet and 35 feet bsg at concentrations of 4.7 µg/l and 3.4 µg/l, respectively. Benzene was detected in sample P1-21 at a concentration of 0.014 mg/kg. Toluene, ethylbenzene, and xylenes were detected in sample P2-8 at concentrations of 0.22 mg/kg, 0.62 mg/kg, and 4.2 mg/kg, respectively.

A.5. STRATIGRAPHY

In general, a distinct zone of gray-brown to black, moist to saturated peat and clay with a strong, stale odor was encountered throughout the site west of boring P1. The top of the peat zone was encountered at depths between approximately 7 feet on the western end of the site and 12 feet on the eastern end in boring P7, with thickness ranging from approximately 7 feet in boring P2 (east) to 20 feet in boring P4 (west). Clay and sandy clay were encountered in borings P3, P4, and P7 at depths above approximately 7 feet bsg, and gray to dark brown, fine-grained and poorly graded sand and silty sand were identified east of boring P1 and throughout the remaining depth intervals in all other borings.

APPENDIX B

APPENDIX B - GROUND WATER SAMPLE COLLECTION PROCEDURES
RINEHART OIL, INC. - OAKLAND TRUCK STOP
1107 5th Street, Oakland, California

B.1. GROUND WATER SAMPLING PROCEDURES

Prior to purging and sampling the ground water monitoring wells, static water level was measured using an electric water level indicator. Water level data was recorded to the nearest 0.01 foot from a reference point marked on the top of the PVC well casing. Before and after each use, the measuring device was rinsed with water.

B.1.1. Well Purging

Subsequent to measurement of depth to water and prior to sampling, the well was purged to ensure that the sample is representative of ground water in the formation, rather than of water standing in the well casing. Monitoring wells were purged by using a disposable polyethylene bailers. The disposable polyethylene bailers is disposed of after one use and required no decontaminating, minimizing cross contamination due to sampling devices. The wells were purged until: 1) a minimum of three casing volumes was removed from each well; and 2) field-measured ground water parameters including temperature, electrical conductivity, and pH had stabilized. Purge water generated during sampling activities was contained on-site in an appropriately labeled 55-gallon drum.

B.1.2. Sample Withdrawal

Following 80 percent recovery of ground water within the well after purging, ground water samples were collected from the monitoring wells using disposable polyethylene bailers. These bailers are disposed of after one use and required no decontaminating, minimizing cross contamination due to sampling devices. The samples were drawn and collected in such a manner that agitation and exposure of the ground water to the atmosphere was minimal. Sample containers were filled using the appropriate disposable sampling attachment which allows controlled flow out of the bottom of the bailer.

B.1.3. Sample Handling

The ground water samples for BTEX, TPH-g, Fuel Oxygenate and Lead Scavenger analysis were collected into laboratory-supplied 40-ml volatile organic analysis (VOA) vials. Ground water samples for TPH-d analysis were collected into laboratory supplied 1-liter amber bottles. Following collection the samples were appropriately labeled and placed on ice in a cooler until delivered to the laboratory for analysis. Chain-of-custody protocols were implemented to document sample custody transfer from the field to the analytical laboratory. A chain-of-custody form accompanied the

APPENDIX B
PAGE 2 OF 2

samples.

B.2. EQUIPMENT DECONTAMINATION

Prior to sample collection, all sampling tools used for sample collection were thoroughly washed with a solution of Alconox and rinsed with clean water.
