**Results of Semi-Annual Groundwater Monitoring on June 27, 2000**  
**2662 Fruitvale Avenue**  
**Oakland, California**

Dear Mr. Cotton:

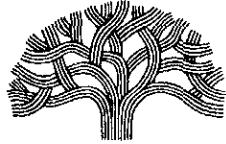

Innovative Technical Solutions, Inc. (ITSi) is pleased to provide the results of the semi-annual groundwater monitoring performed on June 27, 2000, for the property located at 2662 Fruitvale Avenue in Oakland.

Figure 1 shows the site layout and approximate location of the monitoring wells sampled as part of this semi-annual groundwater monitoring event. The semi-annual groundwater monitoring included the monitoring of seven monitoring wells, MW-F1 through MW-F6 and MW-13, and sampling of five monitoring wells, MW-F2, MW-F4, MW-F5, MW-F6, and MW-13. Monitoring wells MW-F1 and MW-F3 were removed from the semi-annual monitoring program as suggested in the November 18, 1999, letter from Alameda County. Monitoring well MW-F2 was retained to provide an upgradient "background" water sample.

The purpose of this groundwater monitoring program is to identify changes in shallow groundwater quality at the site over time, including an evaluation of groundwater conditions that may serve as indicators of intrinsic bioremediation of petroleum hydrocarbons occurring beneath the site. On October 31, 1998, oxygen-releasing compounds (ORC) were placed in the saturated zone along the downgradient property line to enhance natural biodegradation of the petroleum hydrocarbons, and a petroleum hydrocarbon-absorbent sock was placed in MW-13 to recover available free product during this monitoring event. These events were documented in the *Completion Report, Treatment of Groundwater Impacted with Petroleum Hydrocarbons Using Enhanced Natural Bioremediation*, (Innovative Technical Solutions, Inc., December 28, 1998).

**Subject: Results of Semi-Annual Groundwater Monitoring on June 27, 2000  
2662 Fruitvale Avenue Oakland, California**

Dear Mr. Chan:

Enclosed is a copy of the subject report, prepared by our consultant, Innovative Technical Solutions, Inc., for the property located at 2662 Fruitvale Avenue in Oakland.

Groundwater quality results are consistent with data collected from the previous monitoring events. Free-floating product was not observed in any of the wells. We plan to start hydrogen peroxide addition to wells MW-F4 and MW-13 in September 2000. Prior to these activities, a work plan will be submitted to you for review, comment, and approval.

Please call me at 238-6259, if you have any questions or require additional information.

Sincerely,

Joseph A. Cotton  
Environmental Program Specialist

## SCOPE OF WORK

Prior to groundwater sample collection, the depth to groundwater was measured in each of the groundwater monitoring wells. The groundwater monitoring wells were checked for the presence of floating product using disposable bailers. Product was not observed in the groundwater monitoring wells. Depth to water levels were measured in each of the monitoring wells using a water level meter accurate to 0.01 foot. Depth to water measurements were recorded on a Monitoring Well Water Level Measurement Form for each monitoring well. A copy of the Monitoring Well Water Level Measurement Form is included in Appendix A.

Subsequent to depth to water measurements, the monitoring wells were purged using clean disposable bailers. The water column in each groundwater monitoring well was used for the calculation of three well casing water volumes to estimate the approximate amount of water to be removed for stabilization. Water was removed from the monitoring wells by hand bailing until at least three volumes were removed. The field parameters of pH, conductivity, temperature, ORP (mV), and dissolved oxygen were observed during purging activities for indications of aquifer and groundwater stabilization. The field parameters were recorded on Monitoring Well Purge and Sample Forms. Copies of the Monitoring Well Purge and Sample Forms are included in Appendix A.

Groundwater samples were collected from each monitoring well using the disposable bailers. Disposable bailers were dedicated for use only once at each monitoring well and then discarded. Groundwater for sample collection was transferred from the dedicated bailers into preserved laboratory-provided sample containers. Groundwater samples containers were then labeled, placed on ice in an insulated cooler, and transported under chain-of-custody procedures to Chromalab, Inc., a California-certified laboratory.

Groundwater samples were analyzed for the following constituents:

- TPH as gasoline (TPHg) by modified EPA Method 8015
- Benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Method 8020A
- Nitrate, sulfate, total and soluble iron.

## RESULTS

Groundwater elevations are summarized in Table 1 and shown on Figure 1. Results of groundwater sample analyses are summarized in Table 2 and shown on Figures 2 and 3. Copies of the analytical results and chain-of-custody forms are included in Appendix B.

Depth to groundwater ranged from approximately 9 to 10 feet below ground surface (bgs). Groundwater flow direction was generally towards the west-southwest, at a gradient of approximately 0.02 feet per foot. The groundwater flow direction as measured on June 27, 2000 is generally consistent with groundwater flow directions from previous monitoring events. Minor variation to the overall flow direction in the area where the ORC was placed may possibly show the effect of the ORC slurry.

Floating product was not observed in the seven groundwater monitoring wells monitored during this monitoring and sampling event. As noted above, a petroleum hydrocarbon-absorbent sock was placed in MW-13 to remove available free product from the surface of the groundwater. This petroleum hydrocarbon-absorbent sock was replaced during this sampling event. The absorbent sock removed from monitoring well MW-13 during this event exhibited a slight black staining at the surface water interface and a slight petroleum hydrocarbon odor was noted.

### Petroleum Hydrocarbons

TPHg was detected in groundwater samples collected from two monitoring wells, MW-F4 and MW-13, at concentrations of 10 and 6.1 milligrams per liter (mg/L), respectively. TPHg was reportedly not detected (at a detection limit of 0.05 mg/L) in the groundwater samples collected from monitoring wells MW-F2, MW-F5 and MW-F6.

BTEX compounds were detected in two monitoring wells, MW-F4 and MW-13, as discussed below:

- Benzene was detected in groundwater samples collected from MW-F4 and MW-13 at concentrations of 0.08 and 0.11 mg/L, respectively. Benzene concentrations detected in MW-F4 and MW-13 exceed the Maximum Contaminant Level (MCL) for benzene of 0.001 mg/L.
- Ethylbenzene was detected in groundwater samples collected from MW-F4 and MW-13 at concentrations of 1.1 and 0.27 mg/L, respectively. The ethylbenzene concentration detected in MW-F4 exceeds the MCL for ethylbenzene of 0.7 mg/L.
- Xylenes were detected in groundwater samples collected from MW-F4 and MW-13 at concentrations of 0.32 and 0.038 mg/L, respectively.

BTEX compounds were reportedly not detected (at a detection limit of 0.0005 mg/L) in groundwater samples collected from the remaining three monitoring wells sampled.

### Intrinsic Bioremediation Indicator Compounds

Table A below provides the results of bioremediation indicator parameters, including laboratory and field measurements for the June 27, 2000 groundwater monitoring and sampling event.

Table A: Bioremediation Indicator Parameters

Monitoring Well ID	Total Iron (mg/L)	Soluble Iron (mg/L) $\text{Fe}^{2+}$	Nitrate (mg/L)	Sulfate (mg/L)	Dissolved Oxygen	ORP
MW-F2	53	<0.10	<1.0	2	10.74	130
MW-F4	160	<0.10	<1.0	<1.0	10.63	-57
MW-F5	60	<0.10	20	37	10.14	157
MW-F6	10	<0.10	<1.0	9	10.96	141
MW-13	15	<0.10	1.0	2	10.91	-48

As shown above, soluble iron, representing ferrous iron ( $\text{Fe}^{2+}$ ), was not detected in the groundwater monitoring wells sampled this event.

Nitrate was detected in two of the five monitoring wells sampled, MW-F5 and MW-F6, at concentrations of 20 mg/L and 1.0 mg/L, respectively. Sulfate was detected in four of the five wells sampled, at concentrations ranging from 2 to 37 mg/L. The lowest concentrations of nitrate and sulfate were reported in samples from wells within or adjacent to the area of petroleum hydrocarbon-affected groundwater.

Dissolved oxygen, as monitored in the field during purging of the monitoring wells, was relatively high in the five monitoring wells at approximately 10 mg/L. ORP measurements ranged from -57 to -48 mV in monitoring wells MW-F4 and MW-13, within the area of petroleum hydrocarbon-affected groundwater. ORP ranged from a low of 130 mV in monitoring well MW-F2 to a high of 157 mV in monitoring well MW-F5, outside the area of petroleum hydrocarbon-affected groundwater.

## DISCUSSION

Free floating product was not observed in monitoring well MW-13 or the other monitoring wells during the January 2000 sampling event. As noted above, a petroleum hydrocarbon absorbent sock was replaced in MW-13 to remove floating product from the groundwater surface, and is routinely replaced during each monitoring event.

Concentrations of TPHg and BTEX were reported in MW-F4 and MW-13, located in the southwest corner of the site and offsite to the southwest, respectively. These results are consistent with the data collected during previous monitoring events, and show a general decrease from the previous sampling event.

The extent of the plume appears relatively limited. TPHg and BTEX were not reported in up-gradient monitoring well MW-F2. TPHg and BTEX were not reported in MW-F5 and MW-F6, which are located downgradient of MW-13. Previous sporadic detection of TPHg (June 1995), benzene (June 1997), and xylenes (December 1995) indicate MW-F5 is located near the downgradient margin of the plume. Continued water quality monitoring of MW-F5 and MW-F6 should be performed to evaluate potential changes in water quality in these downgradient wells.

Intrinsic bioremediation indicator parameters are generally indicative of active biodegradation occurring in groundwater beneath the site, although the low ORP values in the monitoring wells within the petroleum hydrocarbon-affected groundwater suggests an oxygen depleted environment which would not readily support continued aerobic degradation. The significant difference in ORP between wells within and outside the petroleum hydrocarbon-affected groundwater, with no significant difference for DO, suggests the dissolved oxygen readings may not reflect *in-situ* conditions.

Since the introduction of ORC, several trends have been observed which support the effectiveness of the ORC in reducing overall TPHg and benzene concentrations in the affected groundwater. Prior to introduction of the ORC, seasonal water level fluctuations significantly affected TPHg concentrations, especially in monitoring well MW-4 close to the apparent source area. Since the introduction of the ORC, the historic peaks in TPHg concentrations previously observed during the higher groundwater elevations in the winter have been moderated. This is apparent in Figure 4A

and 4B showing graphs of the historical concentrations of TPHg and benzene in monitoring wells MW-4 and MW-13.

## RECOMMENDATIONS

Based on the results of this semi-annual monitoring and sampling event, the following activities are recommended:

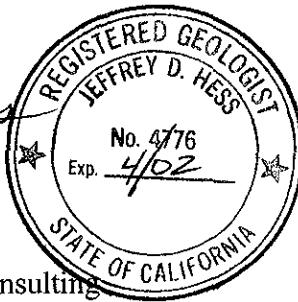

- Continued semi-annual water quality monitoring of MW-F2, MW-F4, MW-F5, MW-F6 and MW-13 to monitor the extent of the hydrocarbon plume and the effects of intrinsic bioremediation on the plume.
- Continued evaluation of intrinsic bioremediation parameters to assess the effectiveness of ORC emplacement.
- Application of discrete doses of 1-3% medical-grade hydrogen peroxide in monitoring wells MW-F4 and MW-13 to encourage both the chemical oxidation of the TPHg and benzene, and continued biodegradation of these chemicals.

Please call me if you have any questions or need additional information.

Sincerely,

*Jeffrey D. Hess*

## DAILY ACTIVITY REPORT

### DESCRIPTION OF FIELD ACTIVITIES AND EVENTS.

Meet w/ Mark Sorensen at ITSI Walnut Creek, CA. Stop at OHS & get rope + ice. Leave for site. Arrive site.

Keys for site do not fit gate. There is a lock for the fence gate on a chain (not attached to fence) (this chain was not long enough to attach to the fence). The lock was secured through the fence. A unknown lock is securing the gate. Entry was possible by removing the bolt securing the latch with the lock. Bolt cutters needed to remove the lock that is securing the chain link fence.

Measure wells for depth to water using Solinst water probe.

Wells MW-F6 needs 5/16" Allen wrench

MW-13 needs 9/16" wrench (really tight)

2" compression caps on all seven wells need replaced. They are just too old & the rubber does not tighten down. Most bolts on well boxes are missing.

MW-F1 needs sanitary concrete seal filled in or replaced.

Every well has dedicated tubing + filters except MW-F~~3~~-13. F2. These tubing + filters are coiled inside the well boxes.

Set up barrel at east side of site. Has @ 25 gallons labbed C-27-00

Site is was generally clean of trash + weeds. Site was secure upon arrival.

Order MW-F5, MW-F2, MW-F6, MW-F4 + MW-13. Wells MW-F3 + MW-F1 were not part of the Quarterly sampling program.

Samples were analyzed for TPH-g, BTEX, total Fe, Soluble Fe, Nitrates, Sulfides. Parameters monitored during purging were pH, Temp, Conduct, DO, ORP, Turbidity. Well MW-F2 → the ORP measurements were re-taken after purging because of mis-setting the parameters of the ORPmeter. These readings are recorded on the MW purge + sampling form.

The sack was replaced in MW-13. Close site.

Return samples to lab for analysis. Return to office.

Dear Jeff.

Attached is our report for your samples received on Tuesday June 27, 2000  
This report has been reviewed and approved for release. Reproduction of this report  
is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after July 27, 2000  
unless you have requested otherwise. We appreciate the opportunity to be of service to you.  
If you have any questions, please call me at (925) 484-1919. You can also contact me via email.  
My email address is: ssidhu@chromalab.com .

Sincerely,

Surinder Sidhu
