7194 AMADOR VALLEY BOULEVARD  
DUBLIN, CALIFORNIA**

**INTRODUCTION**

This report presents the results of groundwater monitoring by Enesco Environmental Services, Inc. (EES) at the former Shell Station located at 7194 Amador Valley Boulevard, in the City of Dublin, Alameda County, California (see Figure 1). EES has been collecting groundwater samples for laboratory analysis at this site since May 1988. This EES quarterly groundwater sampling report includes all data acquired at the site since the issuance of the March 1989 quarterly report. The program objectives are listed below.

- Plot the groundwater contour surface and inferred flow direction.
- Investigate for the presence of a petroleum hydrocarbon plume and its concentrations.
- Compare current and past data.

The existence and degree of hydrocarbon contamination is determined by (1) checking for the presence of free-floating petroleum product in the groundwater monitoring wells and measuring its thickness and (2) performing laboratory analyses on groundwater samples to determine concentrations of total petroleum hydrocarbons as gasoline (TPHG), and specific concentrations of benzene, toluene, ethyl benzene, and total xylenes (BTEX).

## **BACKGROUND**

EES, at the request of Shell Oil Company (Shell), is continuing the investigation of hydrocarbon contamination in the soil and groundwater beneath the former Shell Station located at 7194 Amador Valley Boulevard. EES completed a preliminary soil and groundwater investigation at this site in April 1988 which confirmed the presence of hydrocarbon contamination in the soil and groundwater beneath the site. This was followed by an EES supplemental soil and groundwater investigation completed in November 1988, which found soil and groundwater contamination beyond the site boundaries. In June 1988, a final assessment report was completed which determined limits of the contamination down groundwater gradient from the site.

This report details the results of the ongoing groundwater monitoring and sampling phase of this investigation. EES installed groundwater monitoring wells MW-1 through MW-4 within the site boundaries between May 4 and May 9, 1988. Groundwater monitoring wells MW-5, MW-6, and MW-7 were installed as part of the supplemental off-site field investigation conducted between July 19, and August 12, 1988. MW-5 is screened at a deeper interval than the other wells to monitor the lower depths of the affected aquifer. EES installed five additional off-site monitoring wells (MW-8 through MW-12) between February 21 and 23, 1989, and sampled the groundwater from these wells beginning in March 1989. The locations of these groundwater monitoring wells are shown on the Site Plan (Figure 2).

## **GROUNDWATER SAMPLING**

The aforementioned monitoring wells are sampled monthly by EES and analyzed for the presence of TPHG and BTEX by a Shell-approved, state-certified laboratory. Sampling of monitoring wells is performed in accordance with EES protocol (Appendix B). The results of these analyses are presented in Table 1. Purge water generated during the sampling of these wells is placed into properly labeled 55-gallon drums on site and then transported by a licensed hauler to a recycling facility. At Shell's request, EES performed additional inorganic analyses during the April

groundwater sampling to determine the value of these constituents prior to initiation of any groundwater remediation plan. The inorganic analyses included determination of: total alkalinity, hardness, total suspended solids, total dissolved solids, iron, and pH. The results of these analyses are presented in Table 2.

### SITE CONDITIONS

All monitoring wells are field-checked for petroleum odor, sheen, and the presence of floating product before sampling. EES sample technicians have noted no petroleum sheen or floating product in the wells during this investigation but did detect petroleum odor in groundwater purged from well MW-1. A slight, sporadic petroleum odor was also detected in wells MW-2, MW-3, MW-4, MW-5, MW-6, and RW-1.

Laboratory analyses revealed TPHG and most BTEX compounds in all of the groundwater samples from wells MW-1, MW-3, MW-4, and MW-6. Groundwater from MW-2 had low concentrations of TPHG and BTEX in the March and April analyses; however, only benzene was detected in the May analyses. In MW-5, no TPHG or BTEX were detected in the March or April groundwater analyses; however, a low concentration of benzene was detected in the May analyses. TPHG and BTEX were detected in all groundwater samples from MW-10, except in March when ethyl benzene was not detected. No TPHG or BTEX were detected in groundwater from MW-7, MW-8, MW-9, MW-11, and MW-12. Laboratory analyses of RW-1 revealed TPHG and benzene, with sporadic occurrences of toluene and ethyl benzene. No xylenes were detected in groundwater from this well.

Results of these chemical analyses are presented in Table 1, and copies of the chains-of-custody and laboratory reports are presented in Appendix B. EES has developed logarithmic graphical representations of current data to show the variations in concentrations of TPHG and BTEX with respect to time. These graphs are presented as Figures 3 through 10. (NOTE: There are no graphical representations for MW-8, MW-9, MW-11 and MW-12 due to the absence of detectable concentrations of TPHG or BTEX).

EES has prepared groundwater surface contour maps based upon water depth data collected from the monitoring wells (Figures 11 through 13). The apparent groundwater surface is inclined to the southeast, and the gradient has varied from approximately 0.0095 to 0.0021 feet per foot over the course of this study.

### LONG-TERM MONITORING

EES will continue monthly monitoring of these wells. This monitoring will include: (1) depth-to-water measurements; (2) field checks for odor, sheen, or floating petroleum product; and (3) collection of groundwater samples for analysis by a Shell-approved, state-certified laboratory. The samples will be tested for the presence of TPHG and BTEX. EES will issue the next quarterly groundwater sampling report in September 1989.

### CONCLUSIONS

1. Groundwater elevations at the site ranged from 328.49 to 325.59 feet above mean sea level during the last quarter.
2. Laboratory analyses revealed TPHG and BTEX in the groundwater samples from wells MW-1, MW-3, MW-4, and MW-6. TPHG and BTEX occurred sporadically in groundwater samples from MW-2, MW-5, MW-10 and RW-1. No TPHG or BTEX was detected in groundwater samples collected from MW-7, MW-8, MW-9, MW-11, or MW-12.
3. EES will continue with the current monitoring schedule. The next quarterly groundwater monitoring report, to be issued in September 1989, will include monthly depth, flow direction, gradient, and quality data derived from monitoring wells MW-1 through MW-12, and RW-1.

### REPORTING REQUIREMENTS

A copy of this report should be forwarded to the following agencies:

Alameda County Flood Control and  
Water Conservation District, (Zone 7)

### DISCLAIMER

This report has been prepared solely for the use of Shell and any reliance on this report by third parties shall be as such party's sole risk.

### LIMITATIONS

The discussions and recommendations presented in this report are based on the following:

1. The exploratory test borings drilled at the site.
2. The observations of field personnel.
3. The results of laboratory analyses performed by a state-certified laboratory.
4. Our understanding of the regulations of the State of California and Alameda County and/or the City of Dublin.

It is possible that variations in the soil or groundwater conditions could exist beyond the points explored in this investigation. Also, changes in the groundwater conditions could occur sometime in the future due to variations in rainfall, temperature, regional water usage or other factors.

The service performed by Enesco Environmental Services, Inc. has been conducted in a manner consistent with the level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions in the Dublin Area. Please note that contamination of soil and groundwater must be reported to the appropriate agencies in a timely manner. No other warranty, expressed or implied, is made.

The chemical analytical data included in this report have been obtained from a state-certified laboratory. The analytical methods employed by the laboratory were in accordance with procedures suggested by the U.S. EPA and the State of California. EES is not responsible for laboratory errors in procedure or result reporting.

**APPENDIX A**

**GROUNDWATER SAMPLING PROTOCOL  
AND  
LABORATORY PROCEDURES**

**ENSCO ENVIRONMENTAL SERVICES, INC.**

**GROUNDWATER SAMPLING PROTOCOL**

## **GROUNDWATER SAMPLING PROTOCOL**

Sampling of groundwater is performed by Enesco Environmental Services, Inc. (EES) sampling technicians. Summarized field sampling procedures are as follows:

1. Measurements of liquid surface in the well and depth of monitoring well.
2. Field check for presence of floating product.
3. Purge well prior to collecting samples.
4. Monitor groundwater for temperature, pH, and specific conductance during purging.
5. Collect samples using Environmental Protection Agency (EPA) approved sample collection devices, i.e., teflon or stainless steel bailers or pumps.
6. Transfer samples into laboratory-supplied EPA-approved containers.
7. Label samples and log onto chain-of-custody form.
8. Store samples in a chilled ice chest for shipment to a state-certified analytical laboratory.

# GROUNDWATER SAMPLING PROCEDURES

## Equipment Cleaning

All water samples are placed in precleaned laboratory-supplied bottles. Sample bottles and caps remain sealed until actual usage at the site. All equipment which comes in contact with the well or groundwater is thoroughly cleaned with a trisodium phosphate (TSP) solution and rinsed with deionized or distilled water before use at the site. This cleaning procedure is followed between each well sampled. Wells are sampled in approximate order of increasing contamination. If a teflon cord is used, the cord is cleaned. If a nylon or cotton cord is used, a new cord is used in each well. All equipment blanks are collected prior to sampling. The blanks are analyzed periodically to ensure proper cleaning.

## Water Level Measurements

Depth to groundwater is measured in each well using a sealed sampling tape or scaled electric sounder prior to purging or sampling. If the well is known or suspected of containing free-phase petroleum hydrocarbons, an optical interface probe is used to measure the hydrocarbon thickness and groundwater level. Measurements are collected and recorded to the nearest 0.01 foot.

## Bailer Sheen Check

If no measurable free-phase petroleum hydrocarbons are detected, a clear acrylic bailer is used to determine the presence of a sheen. Any observed film as well as odor and color of the water is recorded.

### Groundwater Sampling

Prior to groundwater sampling, each well is purged of "standing" groundwater. Either a bailer, hand pump, or submersible pump is used to purge the well. The amount of purging is dependent on the well yield. In a high yield formation, samples will be collected when normal field measurement, including temperature, pH, and specific conductance stabilize, provided a minimum of three well-casing volumes of water have been removed. Field measurements will be taken after purging each well volume. In low yield formations, the well is purged such that the "standing" water is removed and the well is allowed to recharge. (Normal field measurements will be periodically recorded during the purging process.) In situations where recovery to 80% of static water level is estimated, or observed to exceed a two hour duration, a sample will be collected when sufficient volume is available for a sample for each parameter. At no time will the well be purged dry so that the recharge rate causes the formation water to cascade into the well.

In wells where free-phase hydrocarbons are detected, the free-phase portion will be bailed from the well and the volume removed recorded. A groundwater sample will be collected if bailing reduces the amount of free-phase hydrocarbons to the point where they are not present in the well. Well sampling will be conducted using one of the aforementioned methods depending on the formation yield. However, if free-phase hydrocarbons persist throughout bailing, then a groundwater samples will not be collected.

Groundwater sample containers are labeled with a unique sample number, location, product name and number, and date of collection. All samples are logged into a chain-of-custody form and placed in a chilled ice chest for shipment to a laboratory certified by the State of California Department of Health Services.

**ENSCO ENVIRONMENTAL SERVICES, INC.**

**LABORATORY PROCEDURES**

# **LABORATORY PROCEDURES**

## **Selection of the Laboratory**

The laboratories selected to perform the analytical work are certified by the California State Department of Health Services as being qualified to perform the selected analyses. The selected laboratories are reviewed by Enesco Environmental Services, Inc. to ensure that they are certified by the State of California and maintain an adequate quality control program.

## **Chain-of-Custody Control**

The following procedures are used during sampling and analytical activities to provide chain-of-custody control during transfer of samples from collection through delivery to the laboratories. Record keeping activities used to achieve chain-of-custody control are:

- Contact made by sampling organization with facility supervisor and laboratory prior to sampling to alert them of dates of sampling and sample delivery.
- Well location map with well identification number(s) prominently displayed.
- Field log book for documenting sampling activities in the field.
- Labels for identifying individual samples.
- Chain-of-custody record for documenting transfer and possession of samples.
- Laboratory analysis request sheet for documenting analyses to be performed.

### Field Filtration of Samples

Samplers will refrain from filtering TOC, TOX or other organic compound samples as the increased handling required may result in the loss of chemical constituents of interest. Allowing the samples to settle prior to analysis followed by decanting the sample is preferable to filtration of these substances. If filtration is necessary for the determination of extractable organic compounds, the filtration should be performed in the laboratory. It may be necessary to run parallel sets of filtered and unfiltered samples with standards to establish the recovery of hydrophobic compounds when sample must be filtered. All the materials' precautions used in the construction of the sampling train should be observed for filtration apparatus. Vacuum filtration of groundwater samples is not recommended.

Water samples for dissolved inorganic chemical constituents (e.g., metals, alkalinity and anionic species) will be filtered in the field.

### Sample Containers

Sample containers vary with each type of analytical parameter. Selected container types and materials are non-reactive with the sample and the particular analytical parameter being tested. Appropriate containers for volatile organics are glass bottles of at least 40 milliliters in size fitted with teflon-faced silicon septa. Sample containers are properly cleaned and sterilized by the certified laboratory according to the EPA protocol for the individual analysis.

### Sample Preservation and Shipment

Various preservatives are used by the certified laboratory to retard changes in samples. Sample shipment from Enesco Environmental Services to laboratories performing the selected analyses routinely occurs within 24 hours of sample collection.

## Analytical Procedures

The analysis of groundwater samples is conducted in accordance with accepted quantitative analytical procedures. The following four publications are considered the primary references for groundwater sample analysis, and the contracts with the laboratories analyzing the samples stipulate that the methods set out in these publications be used. Please note that procedures used are periodically updated by federal and state agencies, and the certified laboratories amend analysis as required by the update.

- Standard Methods for the Examination of Water and Wastewater, 16th Ed., American Public Health Association, et al., 1985.
- Methods for Chemical Analysis of Water and Wastes, U.S. EPA, 600/4-79-020, March 1979.
- Test Methods for Evaluation of Solid Waste: Physical/Chemical Methods, U.S. EPA SW-846, 1982.
- Methods for Organic Chemical Analysis of Municipal and Industrial Wastewater, EPA, 600/4-82-057, 1982.
- Practical Guide for Groundwater Sampling, EPA, 600/2-85/104, September 1985.
- RCRA Ground-Water Monitoring Technical Enforcement Guidance Document, EPA, September 1986.

## Analytical Methods

The analytical methods used by the selected laboratories are those required by the type of analysis (fuels, metals, etc.). These methods are those currently approved by the State Regional Water Quality Control Board.

Purchase Order#: 12495

Dear Mr. Parrish:

Your samples have been received for analysis. The REPORT SUMMARY lists your sample identifications and the analytical methods you requested. The following sections are included in this report: RESULTS and QUALITY ASSURANCE.

NOTE: Amounts reported are net values, i.e. corrected for method blank contamination.

If there is any more that we can do, please give us a call. Thank you for using ANAMETRIX, INC.

Sincerely,

ANAMETRIX, INC.

1330-20-7	Total Xylenes	2	28
	TPH as Gasoline	20	930
	TPH as Diesel	10	110

ND - Not detected at or above the practical quantitation limit for the method.

TPHg - Total Petroleum Hydrocarbons as gasoline is determined by GCFID using EPA Method 5030.

TPHd - Total Petroleum Hydrocarbons as diesel is determined by GCFID following either EPA Method 3510 or 3550.

BTEX - Benzene, Toluene, Ethylbenzene, and Total Xylenes are determined by modified EPA 8020.

All testing procedures follow California Department of Health Services (Cal-DHS) approved methods.

Dear Mr. Parrish:

Your samples have been received for analysis. The REPORT SUMMARY lists your sample identifications and the analytical methods you requested. The following sections are included in this report: RESULTS and QUALITY ASSURANCE.

NOTE: Amounts reported are net values, i.e. corrected for method blank contamination.

If there is any more that we can do, please give us a call. Thank you for using ANAMETRIX, INC.

Sincerely,

ANAMETRIX, INC.

Sarah Schoen Ph.D.  
GC Manager

Dear Mr. Costello:

Your samples have been received for analysis. The REPORT SUMMARY lists your sample identifications and the analytical methods you requested. The following sections are included in this report: RESULTS and QUALITY ASSURANCE.

NOTE: Amounts reported are net values, i.e. corrected for method blank contamination.

If there is any more that we can do, please give us a call. Thank you for using ANAMETRIX, INC.

Sincerely,

ANAMETRIX, INC.

Dear Mr. Costello:

Your samples have been received for analysis. The REPORT SUMMARY lists your sample identifications and the analytical methods you requested. The following sections are included in this report: RESULTS and QUALITY ASSURANCE.

NOTE: Amounts reported are net values, i.e. corrected for method blank contamination.

If there is any more that we can do, please give us a call. Thank you for using ANAMETRIX, INC.

Sincerely,

ANAMETRIX, INC.

*Sarah Schoen*

7194 Amador Valley Blvd.  
Dublin, CA

Dear Mr. Costello:

Your samples have been received for analysis. The REPORT SUMMARY lists your sample identifications and the analytical methods you requested. The following sections are included in this report: RESULTS and QUALITY ASSURANCE.

NOTE: Amounts reported are net values, i.e. corrected for method blank contamination.

If there is any more that we can do, please give us a call. Thank you for using ANAMETRIX, INC.

Sincerely,

ANAMETRIX, INC.

Sarah Schoen, Ph.D.  
GC Manager

 Date anl. TOG : N/A

CAS #	Compound Name	Detection Limit (ppm)	Amount Found (ppm)
71-43-2	Benzene	0.0005	0.0013
108-88-3	Toluene	0.0005	ND
100-41-4	Ethylbenzene	0.0005	ND
1330-20-7	Total Xylenes	0.001	ND
	TPH as Gasoline	0.05	ND

ND - Not detected at or above the practical quantitation limit for the method.

TPHg - Total Petroleum Hydrocarbons as gasoline is determined by GCFID using EPA Method 5030.

BTEX - Benzene, Toluene, Ethylbenzene, and Total Xylenes are determined by modified EPA 8020.

All testing procedures follow California Department of Health Services (Cal-DHS) approved methods.
