Mr. Amir Gholami  
Alameda County  
Department of Environmental Health Services  
1131 Harbor Bay Parkway, Suite 250  
Alameda, California 94502-6577

Subject: StID#3337

Site Address: 3609 International Blvd., Oakland, California

Dear Mr. Gholami:

Enclosed for your review is a copy of SOMA's "Second Quarter 2004 Groundwater Monitoring and Remediation System Operation Report" for the subject property.

Thank you for your time in reviewing our report. If you have any questions or comments, please call me at (925) 244-6600.

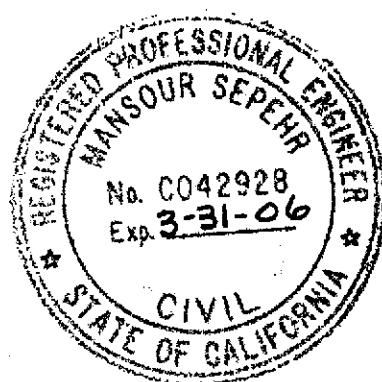

Sincerely,

Mansour Sepehr, Ph.D.,PE  
Principal Hydrogeologist

- Appendix C: Chain of Custody Forms and Laboratory Reports for the Groundwater Extraction Treatment System
- Appendix D: Chain of Custody Form and Laboratory Report for the Soil Vapor Extraction

## **1.0 Introduction**

This report has been prepared by SOMA Environmental Engineering, Inc. (SOMA) on behalf of Mr. Abolghassem Razi, the owner of Tony's Express Auto Service, which is located at 3609 International Boulevard at the intersection of 36<sup>th</sup> Avenue in Oakland, California (the "Site"), as shown in Figure 1.

The Site is located in an area where the surrounding properties are primarily commercial businesses and residential housing. The Site currently houses a gasoline service station and convenience store. During Third Quarter 2002 the station was remodeled and several hydraulic hoists were removed. The station no longer has an auto repair facility. Figure 2 illustrates the locations of the main service station, dispenser islands, underground storage tanks (USTs), the on-site and off-site groundwater monitoring wells, and neighboring properties.

This report summarizes the results of the Second Quarter 2004 groundwater monitoring event, which was conducted at the Site on April 29 and April 30, 2004. Included in this report are the bioattenuation parameters measured in the field for each groundwater sample. Also included in this report are the results of the laboratory analysis on the groundwater samples, which were analyzed for:

- Total petroleum hydrocarbons as gasoline (TPH-g)
- Benzene, toluene, ethylbenzene, total xylenes (collectively referred to as BTEX)
- Methyl tertiary Butyl Ether (MtBE)

In addition to the above laboratory analyses, a natural attenuation study was conducted during this monitoring event. This study consisted of measuring groundwater bioattenuation parameters, which included dissolved oxygen (DO), ferrous iron ( $Fe^{+2}$ ), nitrate ( $NO_3^-$ ) and sulfate ( $SO_4^{2-}$ ). The objective of the natural attenuation study was to evaluate whether the petroleum hydrocarbons found in the groundwater were biodegrading. Therefore, groundwater samples collected

during this monitoring event were analyzed for common electron acceptors and other geochemical indicators. The results of these analyses are also described in this report.

These activities were performed in accordance with the general guidelines of the Regional Water Quality Control Board (RWQCB) and the Alameda County Environmental Health Services (ACEHS).

This report also describes the operation of the groundwater extraction system installed by SOMA in December 1999, as well as the operation of the vapor extraction system, which was installed by SOMA in July 2000. The locations of the groundwater extraction system and the vapor extraction system are displayed in Figure 2.

### **1.1 Background**

In 1992, Soil Tech Engineering, Inc. (STE) conducted an initial environmental investigation to determine whether or not the soil near the product lines and USTs had been impacted by petroleum hydrocarbons. In July 1993, STE removed one single-walled 10,000-gallon gasoline tank and one single-walled 6,000-gallon gasoline tank along with a 550-gallon waste oil tank from the Site. Three double-walled USTs replaced these tanks. Currently, there is one 10,000-gallon double-walled gasoline tank and two 6,000-gallon double-walled gasoline tanks beneath the Site. The locations of the USTs are shown in Figure 2.

In December 1997, Mr. Razi retained Western Geo-Engineers (WEGE) to conduct additional investigations and perform groundwater monitoring on a quarterly basis. The results of the WEGE groundwater monitoring events indicated elevated levels of petroleum hydrocarbons and MtBE in the groundwater.

In April 1999, Mr. Razi retained SOMA to conduct groundwater monitoring, risk-based corrective action (RBCA), a corrective action plan (CAP), as well as soil and groundwater remediation at the Site. The results of the RBCA study indicated that the Site is a high-risk groundwater site; therefore, the soil and groundwater in on and off-site areas warranted remedial actions. The source of the petroleum hydrocarbons in the groundwater was believed to have been the former USTs, which were used to store gasoline at the Site. The results of the CAP study indicated that the installation of a French drain combined with a vapor extraction system would be the most cost effective alternative for the Site's remediation.

In late August 1999, SOMA installed a French drain and groundwater treatment system to prevent further migration of the chemically impacted groundwater. This treatment system has been in operation since early December 1999. In July 2000, following approval from the ACEHS, SOMA installed a vapor extraction system as recommended in our CAP document, dated July 1, 1999.

In January 2002, Environmental Fabric removed old product dispensers and installed new ones in the fuel islands.

On July 25, 2003, SOMA installed an additional on-site extraction pump in the western French drain riser. The extraction pump was installed to create a capture zone in the region around the USTs and to contain off-site migration in the southwestern corner of the Site.

## **2.0 Field Activities**

On April 29 and April 30, 2004, SOMA's field crew conducted a groundwater monitoring event in accordance with the procedures and guidelines of the RWQCB, San Francisco Bay Region. During this groundwater monitoring event a total of eight on-site monitoring wells (MW-1 to MW-8), two off-site monitoring wells (MW-10 and MW-12), and three on-site French drain risers were measured

for depth to groundwater. Well MW-11 was inaccessible during this monitoring event, therefore, no field measurements were taken and no groundwater sample was collected from this well. However, additional field measurements, and grab groundwater samples were collected from all other on and off-site monitoring wells.

The depth to groundwater at each monitoring well and riser was measured from the top of the casing to the nearest 0.01 foot using an electric sounder. The top of the casing elevation data and the depth to groundwater at each monitoring well and riser were used to calculate the groundwater elevation.

Kier and Wright Civil Engineers Surveyors, Inc. surveyed the wells and risers on August 9, 2002. At the time of the survey, monitoring well MW-11 could not be accessed due to obstacles preventing the proper use of surveying equipment, therefore, this well was not surveyed. The top of casing elevations were based on the survey data measured at this time. The elevation data was based on a datum of 14.20 NAVD88. The new survey was conducted to comply with an Electronically Deliverable Format (EDF) request made by the State Water Resources Control Board (SWRCB) Database. The survey data measured by Kier and Wright is presented in Appendix A.

Prior to the collection of samples, each well was purged using a battery operated 2-inch diameter pump (Model ES-60 DC). During the purging activities, in order to obtain accurate measurements of groundwater parameters and especially to avoid the intrusion of oxygen from ambient air into the groundwater samples, field measurements were conducted in-situ (i.e., down-hole inside each monitoring well). The pH, temperature, electric conductivity (EC), dissolved oxygen (DO), turbidity, and Oxygen Reduction Potential (ORP) were measured in-situ using a Horiba, Model U-22 multi-parameter instrument. The Horiba, Model U-22 was calibrated at the Site using standard solutions and procedures provided by the manufacturer. Detailed field measurements are shown in Appendix A.

The purging continued until the parameters for pH, temperature, EC, DO, turbidity, and redox stabilized, or three casing volumes were purged. The groundwater samples were also tested on-site for ferrous iron ( $\text{Fe}^{+2}$ ), and nitrate ( $\text{NO}_3^-$ ), and sulfate ( $\text{SO}_4^{2-}$ ) concentrations once stabilization occurred. Ferrous iron, nitrate, and sulfate were measured colorimetrically using the Hach Colorimeter Model 890.

For sampling purposes, after purging, a disposable polyethylene bailer was used to collect sufficient samples from each monitoring well for laboratory analyses. The groundwater sample was transferred into three 40-mL VOA vials and preserved with hydrochloric acid. The vials were then sealed to prevent development of air bubbles within the headspace. After the groundwater samples were collected, they were placed on ice and maintained at 4°C in a cooler. A chain of custody (COC) form was written and placed along with the samples in the cooler. On April 30, 2004, SOMA's field crew delivered the groundwater samples to Curtis & Tompkins, Ltd. Laboratory in Berkeley, California.

### **3.0    Laboratory Analysis**

Curtis & Tompkins, Ltd., a state certified laboratory, analyzed the groundwater samples for TPH-g, BTEX and MtBE. TPH-g was prepared using EPA Method 5030B and measured using EPA Method 8015B. EPA Method 8021B was used to measure BTEX and MtBE concentrations. Detections of MtBE were confirmed using EPA Method 8260B.

### **4.0    Results**

The following sections provide the results of the field measurements and laboratory analyses for the April 29 and April 30, 2004 groundwater monitoring event.

#### **4.1 Field Measurements**

Table 1 presents the calculated groundwater elevations at each monitoring well and riser. The calculated groundwater elevation data was used to evaluate the impact of the French drain and determine the extent of the groundwater extraction capture zone.

As shown in Table 1, the groundwater elevations for the monitoring wells ranged from 26.63 feet in monitoring well MW-12 to 30.10 feet in monitoring well MW-5. The groundwater elevations for the center, east and west risers were 23.05 feet, 26.86 feet and 25.26 feet, respectively.

In general, the groundwater elevations in all of the monitoring wells and French drain risers decreased, with the exception of the eastern French drain riser. Local recharge rates at each well, as well as, seasonal fluctuations determine the variations in the groundwater elevations. Due to the lack of rain encountered this quarter, the watertable level descended from the ground surface, which caused the groundwater elevations to decrease.

Figure 3 displays the groundwater elevation contour map, as measured during the Second Quarter 2004. Throughout the Site, the groundwater flows towards the French drain at an approximate gradient of 0.075 feet/feet. The lowest site-wide groundwater elevation was measured in the center French drain riser. The calculated groundwater elevation data was also used to evaluate the impact of the French drain operation. Based on the groundwater elevation data, it appears that the French drain is providing excellent hydraulic control in preventing the contaminants from migrating further off-site.

The field notes for the physical, chemical and biodegradation parameters measured during this monitoring event are included in Appendix A.

Naturally occurring biological processes can enhance the removal rate of contaminants in the subsurface. During the degradation process, indigenous bacteria that exist in the subsurface utilize the energy released from the transfer of electrons to drive the redox reactions that remove organic mass from contaminated groundwater. The more positive the redox potential of an electron acceptor, the more energetically favorable is the reaction utilizing that electron acceptor. Based on thermodynamic considerations, the most energetically preferred electron acceptor for redox reactions is DO, followed by nitrate, manganese, ferric iron, sulfate, and carbon dioxide, in descending order of preference. Evaluating the distribution of these electron acceptors can provide evidence of where and to what extent hydrocarbon biodegradation is occurring.

In general, DO was consumed throughout the Site. ORP showed negative redox potentials in all of the wells, with the exception of MW-2 and MW-4. Oxidation of petroleum hydrocarbons appears to have occurred in these monitoring wells at these DO readings. The negative redox potentials indicate these wells are conducive to anaerobic biodegradation.

The presence of  $\text{Fe}^{2+}$  indicates that the available DO in the subsurface has been consumed and anaerobic bacteria began to utilize other electrons acceptors, such as  $\text{Fe}^{3+}$ ,  $\text{NO}_3^-$  and  $\text{SO}_4^{2-}$ , to metabolize dissolved hydrocarbons. Ferrous iron concentrations can thus be used as an indicator of anaerobic biodegradation. Ferrous iron is a product of the reduction reaction of ferric iron and hydrocarbons. The presence of ferrous iron was detected in all of the wells, with the exception of wells MW-4 and MW-10. Ferrous iron concentrations were detected at the equipment's maximum allowable range in monitoring wells MW-3 and MW-6.

Nitrate concentrations were below the minimum allowable level of the Hach Model DR/850 colorimeter in the groundwater samples collected from wells MW-1, MW-3, MW-5, MW-8, MW-10, and MW-12. The presence of high ferrous

iron concentrations in combination with non-detectable nitrate levels is indicative of anaerobic biodegradation beneath the Site.

The absence of sulfate in the groundwater samples may be indicative of an anaerobic methanogenesis process. Sulfate was below the equipment tolerance level in wells MW-1, MW-3, MW-8, MW-10, and MW-12.

#### **4.2 Laboratory Analysis**

Table 1 presents the results of the laboratory analyses on the groundwater samples collected during the Second Quarter 2004 monitoring event. In general, the most impacted monitoring wells this quarter were MW-1 and MW-3, which are in the vicinity of the USTs, and MW-6, which is near the soil vapor extraction (SVE) system.

As shown in Table 1, TPH-g was detected in all of the groundwater samples collected this quarter, with the exception of well MW-4. Figure 4 displays the contour map of the TPH-g concentrations in the groundwater collected during the Second Quarter 2004 monitoring event. As shown in Figure 4, high TPH-g concentrations were detected in the vicinity of the USTs in wells MW-1 and MW-3. The highest TPH-g concentration was detected near the SVE system in MW-6, at 99,000 µg/L.

As shown in Table 1, all BTEX concentrations were at low levels in MW-2, which is near the pump islands. In well MW-4, toluene was below the laboratory reporting limit, all other BTEX analytes were at low levels. In well MW-5, all BTEX analytes were below the laboratory reporting limit, with the exception of a trace concentration of ethylbenzene and toluene. The toluene concentration in well MW-5 may have been misrepresentative due to matrix interferences during analytical testing. The laboratory designated this interference with a "C" flag; see the laboratory report in Appendix B for further clarification. In well MW-7 all BTEX

analytes were below the laboratory reporting limit, with the exception of toluene and total xylene, which were found in trace concentrations. Toluene in well MW-7 was also "C" flagged.

The highest benzene and toluene concentrations were 4,200 µg/L and 590 µg/L, respectively, detected in well MW-3. The highest ethylbenzene and total xylene concentrations were detected in well MW-6 at 2,200 µg/L and 5,200 µg/L, respectively. BTEX constituents were also detected at high concentrations in well MW-1.

Figure 5 displays the contour map of benzene concentrations in the groundwater collected during the Second Quarter 2004 monitoring event. As shown in Figure 5, the highest benzene concentrations were found in MW-1 and MW-3, which are in the vicinity of the USTs, and well MW-6, which is in the vicinity of the vapor extraction system.

MtBE was below the laboratory reporting limit in monitoring wells MW-2, MW-4, MW-6, and MW-8. Figure 6 displays the contour map of MtBE concentrations in the groundwater during the Second Quarter 2004 monitoring event, as analyzed using EPA Method 8260B. The elevated MtBE concentration found in MW-1 may be attributed to the proximity and down-gradient location of MW-1 to the USTs. In general, with the exception of wells MW-1 and MW-3, MtBE was either at low concentrations or below the laboratory reporting limit throughout the Site.

The laboratory report and COC form for the Second Quarter 2004 monitoring event are included in Appendix B.

#### **4.3 Historical Analytical Results**

Table 1 shows the historical groundwater analytical data. The following concentration trends have been observed since the previous monitoring event.

- TPH-g increased in wells MW-1, MW-5, MW-7, MW-10, and MW-12. TPH-g decreased in wells MW-2, MW-3, and MW-8. TPH-g decreased to below the laboratory reporting limit in well MW-4. TPH-g significantly increased in well MW-6.
- In wells MW-1, MW-2, MW-4, and MW-8 all BTEX analytes decreased. In well MW-3 both benzene and ethylbenzene increased, and both toluene and total xylenes decreased. In well MW-5 both benzene and total xylenes remained below the laboratory reporting limit, and both toluene and ethylbenzene slightly increased.
- In well MW-6 all BTEX analytes increased. In well MW-7 both benzene and ethylbenzene remained below the laboratory reporting limit, and both toluene and total xylenes slightly increased. In well MW-10 both benzene and toluene decreased, and both ethylbenzene and total xylenes slightly increased. In well MW-12 all BTEX analytes decreased, with the exception of total xylenes, which remained constant.
- MtBE decreased in wells MW-1, MW-3, MW-8, and MW-12. MtBE increased slightly in wells MW-5, MW-7, and MW-10. MtBE remained constant in well MW-10. MtBE has remained below the laboratory reporting limit in MW-2, MW-4, and MW-6.

## **5.0 Groundwater Treatment System Operation**

The treatment system began operating on December 9, 1999. Since that time, 2,497,350 gallons of groundwater has been treated and discharged, under the existing discharge permit (as of May 3, 2004), into the East Bay Municipal Utility District's (EBMUD's) sewer system.

On July 25, 2004, a downhole pneumatic pump was installed in the western riser of the French drain. On January 9, 2004, the pneumatic downhole pumps in the western and center French drain risers were removed and replaced with

electrical downhole pumps. The schematic of the remediation system is displayed in Figure 7.

As required by the discharge permit and the ACEHS, sampling of the groundwater treatment system has been performed on a routine basis. Table 2 presents the total volume of treated groundwater and the groundwater analytical results. Table 2 shows that all of the effluent samples have been below the discharge limits set forth by EBMUD.

The analytical data for the October 2002 sampling period was erroneous. The high non-detectable concentration levels are due to a high dilution factor caused by the presence of 2-Butanone. During the laboratory testing 2-Butanone was detected at a high concentration of 200,000 µg/L in only the effluent sample. The influent sample concentration for 2-Butanone was only 20 µg/L. Based on the fact that 2-Butanone has not been detected in any of the effluent samples since December 1999, and because there was a very low influent concentration, the sample results shown are erroneous and are only used to depict that sampling was conducted in October 2002. The high TPH-g concentration for this sample may not be representative due to the sample exhibiting unknown peaks, and the sample also exhibiting a fuel pattern, which did not resemble the standard. The laboratory designated these items by "Y" and "Z" flags. However, the system was turned off upon detection of these concentrations and a carbon change-out was performed.

The laboratory reports for the groundwater treatment system are included in Appendix C of this report.

The cumulative weight of TPH-g and MtBE extracted from the groundwater since the installation of the treatment system is displayed in Figure 8. As Figure 8 shows, an approximate total of 171 pounds of TPH-g and 81 pounds of MtBE have been removed since the system's initial start-up until May 3, 2004.

## **6.0 Soil Vapor Extraction System Operation**

The soil vapor extraction (SVE) system consists of 6 vapor extraction wells, a de-moisturizing unit, a blower, and four drums of GAC filters. The vapor extraction system began operating on July 24, 2000. Since then, during its working days, the system has extracted and treated more than 3,000,000 liters per day of soil gas. When the system first began to operate the influent had a concentration of 394 parts per million on volumetric basis (ppmv) of petroleum hydrocarbons. However, it gradually decreased to 68 ppmv after 31 days of operation.

In November 2002, SOMA met a representative of the Bay Area Air Quality Management District (BAAQMD) on-site. At the request of BAAQMD, an air sample was collected from the influent and effluent of the system. The SVE system was determined to be in compliance with the BAAQMD operating permit. In August 2003, another air sample was collected from the SVE system, based on the analytical results the system has remained in compliance.

The total mass of petroleum hydrocarbons removed by the SVE system is shown in Table 3. As of May 5, 2004, the SVE system removed approximately 415.36 pounds of petroleum hydrocarbons from the vadose zone beneath the Site.

The SVE system was turned off in November 2003, and then re-started on April 5, 2004. During the rainy season, the watertable ascends closer to the ground's surface, and thereby, reduces the unsaturated zone beneath the Site. The SVE system, during the rainy season, is inoperable, and becomes operational during the drier season. This allows a greater petroleum mass to be removed in the larger unsaturated region.

On May 5, 2004, all four SVE carbon drums were changed out. On May 10, 2004, samples were collected at the influent and effluent of the SVE system. The samples were collected at the system influent to determine the overall hydrocarbon removal efficiency. The samples were collected at the effluent to

verify that the system was still in compliance with BAAQMD's discharge requirements.

The laboratory report for the soil vapor extraction system is included in Appendix D of this report.

## **7.0 Conclusions and Recommendations**

The findings of the Second Quarter 2004 groundwater monitoring event can be summarized as follows:

1. The groundwater remediation system is providing excellent hydraulic control in preventing further migration of the contaminants.
2. The bio-attenuation study confirmed the occurrence of biodegradation at the Site. Based on the non-detectable levels of DO throughout the Site, and high ferrous iron concentrations detected in wells MW-3 and MW-6, anaerobic bacteria has begun to utilize other electron acceptors such as nitrate and sulfate. Both nitrate and sulfate have been consumed in wells MW-1 and MW-3. Based on this study, the affected areas appear in the vicinity of the USTs in wells MW-1 and MW-3, as well as, the eastern section of the Site in well MW-6.
3. The source area remains in the vicinity of the USTs, in wells MW-1 and MW-3. However, the highest TPH-g concentration was detected in well MW-6. Based on the analytical results from this monitoring event, TPH-g has significantly increased in well MW-6.
4. In the vicinity of the USTs, in well MW-1, all BTEX analytes and MtBE decreased. In well MW-3, both TPH-g and MtBE decreased. In the eastern section of the Site, in well MW-6, increases in concentrations were

detected, with the exception of MtBE, which remained at non-detectable levels.

5. Approximately 2,497,350 gallons of groundwater has been treated and discharged into EBMUD's sewer system, under the existing discharge permit (as of May 3, 2004). All effluent samples from the groundwater treatment system have remained below the allowable discharge requirements. From initial start-up to May 3, 2004, approximately 171 pounds of TPH-g and 81 pounds of MtBE have been removed during the operation of the treatment system.
6. As of May 5, 2004, the SVE system has removed approximately 415.36 pounds of petroleum hydrocarbons from the vadose zone beneath the Site. The operation of the SVE system is based on seasonal fluctuations occurring at the Site. The system is turned off during wetter periods of the year and operational during drier periods.
7. Continuation of the GAC system should decrease the groundwater concentrations throughout the Site. The SVE system was re-started on April 5, 2004, this should decrease the concentrations in the vicinity of well MW-6 during the Third Quarter 2004.

## **8.0 Report Limitations**

This report is the summary of work done by SOMA including observations and descriptions of the Site's conditions. It includes the analytical results produced by Curtis & Tompkins Laboratories as well as the summaries of data produced by previous environmental consultants. The number and location of the wells were selected to provide the required information, but may not be completely representative of the entire site's conditions. All conclusions and recommendations are based on the results of the laboratory analysis. Conclusions beyond those specifically stated in this document should not be inferred from this report.

SOMA warrants that the services provided were done in accordance with the generally accepted practices in the environmental engineering and consulting field at the time of this sampling.

Notes:

- <sup>1</sup> MtBE was analyzed using the EPA Method 8021B and confirmed using B260B.
- C Presence confirmed, but confirmation concentration differed by more than a factor of two.
- H: Heavier hydrocarbons may have contributed to the quantitation.
- NA: Not Analyzed
- ND, < : Not Detected above laboratory reporting limits.
- NS: Not Surveyed.
- Y: Sample exhibits fuel pattern which does not resemble standard.
- \*Top of casing elevations were re-surveyed to comply with the EDF requirements for electronic reporting of data to the State Water Resources Control Board Database on August 9, 2002.
- NA: Not Applicable, Well/Drain did not exist at time of sampling
- NC: Not calculated. No top of casing elevation was available for MW-11.
- NM: Not Measured
- FDC: French drain center riser.
- FDE: French drain east riser.
- FDW: French drain west riser.

Pumping began on December 6, 1999

Notes:

1 Effluent is equivalent to PSP#1  
 2 MTBE was analyzed using EPA Method 8260B, prior to the September 2003. After September 2003,  
 MtBE was only analyzed by EPA Method 8021B.

3 Lab data as shown for Oct. 2002 is erroneous data. During lab analysis a high detection of 2-Butanone  
 was detected in only the effluent sample. The influent sample for 2-Butanone was at only 20 ppb.  
 This caused a high dilution factor causing a high non-detectable value. The high TPH-g value  
 was misrepresentative due to the Y and Z flags.

ND, < : Not Detected above laboratory reporting limits

NA: Not Analyzed

NR: Not recorded. Totalizer reading not recorded.

Y: Sample exhibits fuel pattern which does not resemble standard

Z: Sample exhibits unknown single peak or peaks

Total Mass of Petroleum Hydrocarbons Removed =							415.36
Average Daily Removal Rate (pounds / day) =							0.30

**Table 3**  
**Total Mass of Petroleum Hydrocarbons Removed by Vapor Extraction System**  
**3609 International Boulevard, Oakland, California**

Date	Time	PID (ppmv)		Flow Rate (ft^3/min)	Time Elapsed (Hours)	Air Flow (Liters)	Mass Removed <sup>1</sup> (Pounds)
		Influent	Effluent				

Notes:

- <sup>1</sup> The representative molecular weight of hydrocarbons was assumed to be 78 gram/mole and used the measured temperature of Vapor (36 °C) in converting ppm-v to ppm on mass basis.
- <sup>2</sup> System accidentally shut down from main box, readings taken 30 minutes after startup.
- <sup>3</sup> GAC Replaced
- <sup>4</sup> GAC-1 removed, new GAC installed at effluent end
- <sup>5</sup> SVE System turned off for rainy season due to low influent concentrations
- <sup>6</sup> system down, hoses disconnected and GAC moved for replacement
- <sup>7</sup> system down for electrical repair
- <sup>8</sup> Carbon change-out of three drums, moved new effluent drum on 10/25/01 to GAC-1
- <sup>9</sup> system shut-down due to high effluent value
- <sup>10</sup> System re-started (since November 21, 2001), installed new 4-55 gallon vapor phase carbon vessels, repaired blower
- <sup>11</sup> System was shut-down due to low influent reading
- <sup>12</sup> System was restarted on 6/12/02
- <sup>13</sup> System was re-started but no readings were taken

Prepared for:

SOMA Environmental Engineering Inc.  
2680 Bishop Dr.  
Suite 203  
San Ramon, CA 94583

Date: 19-MAY-04  
Lab Job Number: 172032  
Project ID: 2331  
Location: 3609 Int'l Blvd., Oakland

This data package has been reviewed for technical correctness and completeness. Release of this data has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures. The results contained in this report meet all requirements of NELAC and pertain only to those samples which were submitted for analysis.

Reviewed by: John Parker  
Project Manager

Reviewed by: Operations Manager

This package may be reproduced only in its entirety.

Laboratory Number: 172032  
Client: SOMA Environmental  
Project: 2331  
Request Date: 4/30/2004

### CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for ten water samples requested from the above referenced project on April 30, 2004. The samples were received cold and intact.

**Total Volatile Hydrocarbons:**

In the samples, several surrogate recoveries exceed control limits due to coelution of the surrogate peak with other hydrocarbon peaks. The associated surrogates are acceptable.

No other analytical problems were encountered.

**Purgeable Organics (EPA 8260):**

No analytical problems were encountered.

### CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for three water samples requested from the above referenced project on April 5, 2004. The samples were received cold and intact.

**TVH/BTXE:**

The recoveries for the surrogate trifluorotoluene in the spikes exceed control limits due to coelution of the surrogate peak with other hydrocarbon peaks. The associated surrogates are acceptable.

No other analytical problems were encountered.

## Air Toxics Ltd. Introduces the Electronic Report

- Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail.
- This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.
- This electronic report includes the following:
  - Work order Summary;
  - Laboratory Narrative;
  - Results; and
  - Chain of Custody (copy).

## LABORATORY NARRATIVE

### Modified TO-3

Curtis & Tompkins, Ltd.

Workorder# 0405185

Two 1 Liter Tedlar Bag samples were received on May 12, 2004. The laboratory performed analysis for volatile organic compounds in air via modified EPA Method TO-3 using gas chromatography with photo ionization and flame ionization detection. The method involves concentrating up to 200 mL of sample. The concentrated aliquot is then dry purged to remove water vapor prior to entering the chromatographic system. The TPH (Gasoline Range) results are calculated using the response factor of Gasoline and correspond to the range of hydrocarbons from C5 to C10. A molecular weight of 100 is used to convert the TPH (Gasoline Range) ppmv result to ug/L. See the data sheets for the reporting limits for each compound.

Method modifications taken to run these samples include:

Requirement	TO-3	ATL Modifications
Daily Calibration Standard Frequency	Prior to sample analysis and every 4 - 6 hrs	Prior to sample analysis and after the analytical batch </= 20 samples
Initial Calibration Calculation	4-point calibration using a linear regression model	5-point calibration using average Response Factor
Initial Calibration Frequency	Weekly	When daily calibration standard recovery is outside 75 - 125 %, or upon significant changes to procedure or instrumentation
Moisture Control	Nafion system	Sorbent system
Minimum Detection Limit (MDL)	Calculated using the equation $DL = A + 3.3S$ , where A is intercept of calibration line and S is the standard deviation of at least 3 reps of low level standard	40 CFR Pt. 136 App. B
Preparation of Standards	Levels achieved through dilution of gas mixture	Levels achieved through loading various volumes of the gas mixture

#### Receiving Notes

There were no receiving discrepancies.

#### Analytical Notes

There were no analytical discrepancies.

#### Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:

B - Compound present in laboratory blank greater than reporting limit.

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the detection limit.

M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue
