**RE: FOURTH QUARTER 2008 GROUNDWATER MONITORING RESULTS, FORMER DESERT PETROLEUM, B&C GAS MINI MART, 2008 FIRST STREET, LIVERMORE, CALIFORNIA (STATION ID RO 0000278)**

Dear Mr. Angle:

Golder Associates Inc. has compiled the fourth quarter 2008 groundwater monitoring results for B&C Gas Mini Mart (B&C) [currently named Valley Gas and Mini Mart], 2008 First Street, Livermore, California (Figure 1). This report includes groundwater elevation data, groundwater sampling methods, and results of groundwater chemical analyses.

Seven wells and eight zones in the multi-level wells were successfully sampled for field monitoring and laboratory analysis for a total of fifteen monitoring points. Wells MW-5, 8, 9, 10, and 12 were dry and not sampled. Well MW-6 is obstructed above the water level and was not sampled.

## SITE INFORMATION

### Site Name & Contact

Mr. Balaji Angle  
B&C Gas Mini Mart (currently Valley Gas and Mini Mart, Formerly Desert Petroleum)  
2008 First Street  
Livermore, California 94550  
(510) 654-3461

### Site Description

The B&C property is located on the northeast corner of First and South L Streets in Livermore, California, and currently serves as a gasoline station and mini market called Valley Gas. From at least 1988 until 1994, Desert Petroleum (DP) owned and operated the site. In January 1994, DP sold the site to the current owner, Mr. Balaji Angle. The following site description has been compiled from reports on file with Alameda County Environmental Health Services (ACEHS) and information provided by the site owner.

The site is located in the Livermore Valley groundwater basin, an area of sedimentary deposition containing braided channel systems with complex interfingering. Subsurface investigations

conducted to the west of the B&C site have found an upper unconfined water-bearing zone consisting primarily of gravels with sand and clay. A low-permeability clayey unit is found at depths of approximately 75 to 110 feet below ground surface (bgs). Below the clayey unit, the top of a lower, semi-confined aquifer is found at depths ranging from 110 to 145 feet bgs.<sup>1</sup>

Subsurface work conducted in the B&C area has found predominantly sandy clay, silty sand, silty gravel, and sandy gravel. Over the last 15 years, static water levels have ranged from a low of 69 feet bgs (January 1992) to a high of 17 feet bgs (February 1997). The groundwater flow generally ranges from west of north during the summer and fall months, to north of west during the winter and spring months.

### Previous Work Performed at Site

A preliminary site assessment was conducted in September 1988. Three soil borings were completed; one of which was converted to a monitoring well (MW-1). In March 1994, a 280-gallon waste oil underground storage tank (UST) and 25 cubic yards of soil were removed as part of closing the auto repair shop at the station. Three months later in June, wells MW-2, MW-3, and MW-4 were installed (Figure 2).<sup>2</sup>

In August 1994, free product was encountered in well MW-2, and product removal commenced twice a month. By the end of January 1995 no measurable thickness of product remained, only sheen could be detected.<sup>3</sup> In March 1995, a release was reported to have occurred from the union between a tank subpump and product line. The quantity of the release is unknown.

One gasoline UST at the B&C site failed an integrity test in September 1995. The tank was immediately taken out of commission and ACEHS was notified. In July 1996, further source removal was conducted. Two more gasoline USTs were removed and new double-walled fiberglass USTs and fiberglass piping with automated leak detection were installed (Figure 2). Other remedial activities included the removal of two hydraulic lifts and approximately 700 cubic yards of impacted soil. Also, one 1,000-gallon UST discovered during excavation activities was closed in place with approval from ACEHS and the Livermore Fire Department by grouting with cement sand slurry. In October 1995, two additional monitoring wells (off-site well MW-5 and well MW-6) were installed for the B&C site (Figure 2).

Nine downgradient wells (MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, MW-13, D-1, and D-2) were installed during June and July 1999 to define the downgradient and lateral extent of the plume and provide long-term monitoring locations (Figure 2).<sup>4</sup> Two of the wells, D-1 and D-2, are installed in the semi-confined aquifer below the aquitard. The other wells are installed in the upper water-bearing zone.

<sup>2</sup> Remediation Service Int'l. Soil & Groundwater Investigation Report for 2008 First Street, Livermore, California. July 22, 1994.

<sup>3</sup> Product thickness information from Remediation Service, Int'l field records, "Free Product Removal Logs."

<sup>4</sup> Einarson, Fowler & Watson, November 5, 1999, Report of Downgradient Investigation, B&C Gas Mini Mart, 2008 First Street, Livermore, California.

In July and August 2003, four multi-level wells were installed (CMT-1, CMT-2, CMT-3, and CMT-4). Each was constructed using continuous multi-channel tubing (CMT) and completed with seven sampling ports to monitor groundwater both in the upper water-bearing zone and in the semi-confined aquifer below the aquitard. CMT-4 was installed at the B&C site while CMT-1, CMT-2, and CMT-3 were installed downgradient of the site to better define the lateral extent of the plume in the northwest direction.

Table 1a summarizes the well construction details for all single-screen wells installed on- and off-site, and Table 1b summarizes the well construction details for the four multi-level wells. Onsite well MW-1 was destroyed on November 26, 2007.

The primary constituents of concern are total petroleum hydrocarbons as gasoline (TPH-G); the aromatic compounds benzene, toluene, ethylbenzene, and xylenes (collectively referred to as BTEX); and methyl tertiary-butyl ether (MTBE). Since 1994, concentrations of TPH-G in groundwater have decreased.

### **Interim Remedial Action at Well MW-5**

Floating product first was observed in well MW-5 in October 1998. The well is screened from 15 to 40 feet bgs, and the depth to groundwater has historically ranged from 18 to 33 feet bgs, well within the screened interval of the well. Due to the presence of floating free product in well MW-5, interim remedial actions were taken to remove the floating product from the well. A passive bailer or absorbent sock was selected to remove product from well MW-5 based on well access, the thickness of the product, and the rate at which the product enters the well as it is removed.

Over the time monitored, the absorbent socks have removed sufficient product to reduce the free product thickness to sheen or less. Since September 2002, product sheen has been observed in the purge water from well MW-5 even though no product thickness can be measured.

### **Ozone Sparging Pilot Test**

From August 20 through 24, 2007, Golder installed six dual-completion sparge wells, SP-1 (A, B) through SP-6 (A, B), two deeper screened sparge wells, SP-5C and SP-6C, and a soil vapor extraction (SVE) well.<sup>5</sup> In general the A and B sparge well screens were installed across the source zone at depths between 36 and 48 feet bgs to monitor the source zone, and the C screens were installed at approximately 54 feet bgs to assess vertical migration. The SVE screen was installed from 15 to 25 feet bgs for additional assessment and remediation if warranted. Upon installation of the ozone remediation system onsite, Golder performed a pilot test using groundwater and vapor samples to evaluate the effectiveness of the sparge system. While the pilot test showed a positive effect on VOC concentrations onsite, the significant decline in the water table limited the ability to monitor the ozone sparging test and provide ozone to the source zone. Golder recommended discontinuing the ozone sparging pilot test until the water table increased to above the source zone. A significant increase in the water table occurred in January 2008. The rise in groundwater levels was sufficient to re-saturate the source zone and both sparge point depth zones. As a result, Golder recommended continuing the

---

<sup>5</sup> Golder Associates Inc. Pilot Test Report, B&C Gas Mini Mart, 2008 First Street, Livermore, California. December 7, 2007.

air-sparging pilot test with the revised implementation schedule.<sup>6</sup> The air-sparging pilot test re-started on March 5, 2008. Additional sparge points (SP-2A and B and SP-4A and B) were hooked up to the system on July 3, 2008. The sparging system operation has continued to date. Recommendations for the final remedial approach for on-site and downgradient areas were presented in a corrective action plan, which was submitted on January 21, 2009.<sup>7</sup>

## GROUNDWATER SAMPLING AND ANALYSIS

The groundwater monitoring program for single screen and multi-level wells is summarized in Tables 2a and 2b. In addition to the quarterly monitoring program, Golder analyzed for natural attenuation parameters in wells MW-2, MW-4 and MW-13.

Sampling activities are summarized below. Groundwater sampling methods and results are presented and a discussion of historical analytical trends for site monitoring wells is included.

### Free Product

During this sampling event, Golder personnel checked for free-product in wells MW-2 and (MS)MW-1 where product has historically been detected. No measurable free product was observed in MW-2 and (MS)MW-1 during this monitoring event.

### Groundwater Elevations

On December 8, 2008, Golder personnel measured the depth to water in all groundwater monitoring wells. Water levels were measured to the nearest 0.01-foot using a water level meter, according to standard measuring protocol,<sup>8</sup> and were recorded on a water level data sheet (Appendix A). Groundwater elevations are calculated by subtracting depth-to-water measurements from the top of well casing elevations, surveyed to Livermore City datum, mean sea level (MSL).

The monitoring wells were re-surveyed in 2003 in order to adhere to Geotracker requirements. Tables 3a and 3b summarize the groundwater elevations from the current monitoring event (historical groundwater elevations are included in Appendix C) and reflect the updated survey data. A groundwater contour map, based on the current water level measurements, is presented on Figure 3. Water levels measured in Zone 2 or Zone 3 of the multi-level wells were used to complete the equipotential contours on Figure 3. Compared to the previous quarter groundwater level measurements conducted in August 2008, current groundwater elevations above the regional aquitard are approximately between 1.5 to 6.5 feet lower. Below the aquitard, the current groundwater elevations are up to 4.5 feet higher than the previous quarter. Groundwater flow is slightly north of west and the hydraulic gradient is approximately 0.018 foot per foot. The flow direction and gradient are similar to previous results.

<sup>7</sup> Golder Associates, Inc. Corrective Action Plan, Valley Gas (Formerly B&C Mini Mart), 2008 1<sup>st</sup> Street, Livermore, California. January 21, 2009.

<sup>8</sup> Einarson, Fowler & Watson. Third Quarter 1998 Groundwater Monitoring Results, B&C Gas Mini Mart, Livermore, California, Appendix A. September 10, 1998.

During this quarter, a vertically upward gradient was observed across the aquitard between well pair MW-11/D-1 and MW-12/D-2. An upward gradient was observed across the known aquitard in multi-level wells CMT-1 and CMT-2, and a downward gradient was observed across the known aquitard in multi-level wells CMT-3 and CMT-4.

### **Sampling Methods**

Golder personnel sampled groundwater in the single-screen wells on December 9 and 10, 2008 and sampled groundwater in the multi-level monitoring wells on December 31, 2008. All single-screen wells sampled during this quarter were purged with a one-use weighted disposable polyethylene bailer. Samples were collected from each well using a disposable bailer.

Specific zones in the multi-level wells were purged and sampled using inertial lift methods with dedicated ¼-inch diameter tubing fitted with a check valve. Unless there was insufficient water present, two casing volumes were removed to purge each zone prior to collecting a groundwater sample. Groundwater samples were collected using the inertial lift method.

Field measurements of temperature, pH, turbidity, and electrical conductivity were taken when sufficient water was present; field measured values were recorded on water sample field data sheets (Appendix A). All samples were properly stored (on ice and in coolers) on the day of sampling. Chain-of-custody documentation accompanied the samples through collection and delivery to the analytical laboratory (Appendix B).

Purge water from the multi-level wells was contained in 2 - 5-gallon buckets and discharged to the sewer system. Purge water from the monitoring wells was contained in 55-gallon drums stored at the B&C site. A composite sample was not collected from the purge water on December 31, 2008. A composite sample will be collected from the drummed purge water and analyzed by EPA method 601/602 during the next sampling event, first quarter 2009. The permit allows the discharge of purge water to the sewer system, containing less than 1 milligram per liter (mg/L) of total toxic organics.

### **Analytical Program**

BC Laboratories, Inc. of Bakersfield, California, a state-certified laboratory, performed all analyses. Groundwater samples were analyzed for TPH-G, benzene, toluene, ethylbenzene, and total xylenes (collectively referred to as BTEX compounds) and the oxygenates, methyl tertiary-butyl ether (MTBE), tert-butyl alcohol (TBA), and tert-amyl methyl ether (TAME), by the U.S. Environmental Protection Agency Method 8260. In addition, ethanol was analyzed for in samples from CMT-4.<sup>9</sup> Natural attenuation parameters were analyzed for in samples from wells MW-2, MW-4 and MW-13. Wells MW-5 and CMT-2-Z2 were dry and not sampled. These parameters include dissolved iron, dissolved manganese, total alkalinity, and sulfate.

### **Laboratory Quality Control**

Laboratory analyses occurred within specified holding times. Based on the laboratory QA/QC summaries, the majority of method blanks, laboratory control samples (LCS), matrix spikes (MS),

---

<sup>9</sup> Added per request by D. Drogos, ACEH.

and matrix spike duplicates (MSD) were within laboratory control limits. Where exceptions were noted batches were generally accepted based on supporting LCS recovery data.

### **Analytical Results**

Analytical results for the fourth quarter 2008 are summarized in Tables 4a and 4b (for the single-screen wells and the multi-level wells, respectively). Benzene and MTBE concentrations are presented on Figure 4, and are used to define the greater than 0.5 µg/L concentration plume outlines shown on the figure for these two compounds. Tables of historical analytical results are included in Appendix C.

Over the last ten years of monitoring at the site, concentrations of benzene have steadily decreased in all single-screen site wells (Appendix C). Analysis for MTBE in site groundwater samples began in June 1995. Since then, concentrations of MTBE have decreased significantly; impacted wells from the source area to the distal end of the plume are now showing fairly steady results over time. Seasonal changes in hydrocarbon concentrations are evident in other wells, probably a reflection of seasonal water level fluctuations.

#### Detections in On-Site Wells

Site wells MW-2 and MW-3 have the highest hydrocarbon concentrations this quarter. For the single screen wells near the source area, BTEX and MTBE concentrations detected during this most recent sampling event are within historical ranges. During the current sampling event, upgradient monitoring well MW-4 had concentrations of hydrocarbons within historical ranges TPH-G (340 µg/l), benzene (3.30 µg/l), toluene (1.2 µg/l), and xylenes (2.8 µg/l).

CMT-4 had much lower concentrations of benzene (2.6 µg/l), toluene (0.60 µg/l), ethyl benzene (0.76 µg/l), xylenes (3.5 µg/l), and MTBE (0.53 µg/l) compared to the previous quarter, below the aquitard at the site (i.e., zone 6). The results from CMT 4-Z6 compared to the previous quarter may indicate that the third quarter hydrocarbon detections were the result of sample contamination.

#### Detections in Downgradient Wells

Downgradient of the site, TPH-G, benzene, and MTBE were detected in wells (MS)MW-1 and MW-7. Monitoring well (MS)MW-1 also had low concentrations of toluene, ethyl benzene and xylenes. No hydrocarbons were detected in samples from downgradient wells D-2, MW-13, CMT-1, CMT-2 and CMT-3.

For the single screen wells near the source area, BTEX and MTBE concentrations detected during this most recent sampling event are within historical ranges and generally lower than those previously detected in each well. Downgradient wells will continue to be monitored for changes in water quality.

#### Monitored Natural Attenuation

Three sample locations, MW-4 (upgradient), MW-2 (source area), and MW-13 (mid-plume) were monitored for indicators of continued natural attenuation (Table 4c). MW-5 (distal end of source area) and CMT-2 zone 2 (distal plume), were dry and unable to be monitored. There is an indication of reduced pH, and increased iron, manganese, alkalinity, and sulfate in the plume, indicating ongoing natural attenuation. The parameters typically recover to near upgradient levels at the distal end of the

plume, indicating that natural attenuation appears to be a viable mechanism for controlling the BTEX portion of the plume.

## SUMMARY

Seven single-screen monitoring wells and selected zones from multi-level monitoring wells CMT-1, CMT-2, CMT-3, and CMT-4 were sampled during the fourth quarter 2008. Analytical results from the single-screen well-samples indicated TPH-G, BTEX, and MTBE concentrations that are lower than the previous quarters monitoring results in the wells in proximity to and immediately downgradient of the original source location except for wells MW-2 and MW-3. Multi-level monitoring well CMT4-Z6 had lower concentrations of hydrocarbons below the aquitard at the site (i.e., zone 6). The results from CMT 4-Z6 may indicate that the third quarter hydrocarbon detections were the result of sample contamination.

In general, concentrations of BTEX and MTBE have declined throughout the last several years and show shrinking or stable plume conditions. Declining concentrations appear to be due to natural attenuation based on the shrinking and/or stable BTEX and MTBE plumes, and on-going positive indicators of natural attenuation (reduced oxygen, sulfate and pH, and increased iron, manganese, dissolved methane, and the presence of MTBE degrading bacteria).

Hydrocarbon concentrations at the source area also appear to be declining. However, fluctuations in hydrocarbon concentrations (below historical maximums) are observed on occasion at and near the source area. No free product thickness was measured in any well.

First quarter 2009 groundwater monitoring is scheduled for March 2009. Sampling and analysis will be conducted in accordance with the monitoring program shown on Tables 2a and 2b.

## LIMITATIONS

Golder Associates Inc.'s services on this project were performed in accordance with current generally accepted environmental consulting principles and practices. This warranty is in lieu of all others, be it expressed or implied. Environmental conditions may exist at the site that could not be observed. Where the scope of services was limited to observations made during site reconnaissance, interviews, and/or review of readily available reports and literature, our conclusions and recommendations are necessarily based largely on information supplied by others, the accuracy and sufficiency of which may not have been independently reviewed by us. Our professional analyses are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions between such sampling points. Additional data from future work or changing conditions may lead to modifications to our professional opinions and recommendations. Any reliance on this report, or portions thereof, by a third party shall be at such party's sole risk.

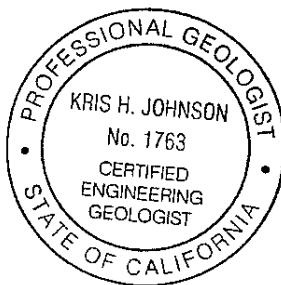

If you have any questions regarding this report, please call us at (408) 220-9223.

Sincerely,

**GOLDER ASSOCIATES INC.**

Q - Quarterly.

A - Annual (during fourth quarter).

I - Inactive (no sampling is proposed for wells MW-11 and D-1).

MNA - Monitored natural attenuation.

Quarterly (Q) and Annual (A) monitoring parameters: TPHg, BTEX compounds, and MTBE. TAME annually only.

Annual sampling for MNA parameters: DO, ORP, dissolved iron and manganese, alkalinity series, nitrate and sulfate (during second quarter).

*Notes:*

Q - Quarterly

A - Annual (during fourth quarter)

I - Inactive (no sampling is proposed for these zones)

MNA - Monitored natural attenuation

Quarterly (Q) and Annual (A) monitoring parameters: TPHg, BTEX compounds, and MTBE. TAME annually only.

Annual sampling for MNA parameters: DO, ORP, dissolved iron and manganese, alkalinity series, nitrate and sulfate (during first or second quarter).

Table 3a  
 Groundwater Elevations in Single-Screen Wells - Fourth Quarter 2008  
 B & C Gas Mini Mart  
 Livermore, California

Well Number	Top-of-Casing Elevation (feet, MSL)	Depth to Water (feet, TOC)	Groundwater Elevation (feet, MSL) <sup>1</sup>	Depth to Free product (feet, TOC)	Product Thickness (feet)
December 8, 2008

### Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.

<i>Notes:</i>																										
ug/L = micrograms per liter																										
TPH-G = total petroleum hydrocarbons as gasoline																										
MTBE = methyl tertiary-butyl ether																										
EDB = 1,2-Dibromoethane																										
EDC = 1,2-Dichloroethane																										
DIPE = Di-isopropyl ether																										
ETBE = Ethyl tert-butyl ether																										
TAME = Tert amyl-methyl ether																										
TBA = Tert-butyl alcohol																										
MS = Mill Springs Park																										
NA= not analyzed																										
NS= not sampled																										
NR = The analytical results for the sample collected from well (MS)MW-1 in June 2003 may not be representative due to unusual post-sample handling procedures.																										
* = well inaccessible; Well MW-6 not sampled due to an obstruction at approximately 28.6 feet below top of casing																										
** = free product hydrocarbon present																										
*** = analytical result from EPA method 8260B																										
<sup>1</sup> Well MW-1 properly destroyed on 11/26/07																										
ND = not detected above reporting limit, limit not available																										
< = less than method reporting limit																										
R = sample re-analyzed past recommended hold time to correct previous result.																										
Some analytical results may not be included in this table, as the results were not available when the data was compiled																										
# Analysis rerun because original results exceeded calibration. Second extraction performed after holding time limit. Results from second extraction presented in table.																										
Highlighted items indicate no adjustment was made to GW elevation when free/floating product present
