SUBJECT: UNDERGROUND STORAGE TANK REMOVAL REPORT
XTRA OIL COMPANY
3495 Castro Valley Blvd.
Castro Valley, CA

Gentlemen:

P&D Environmental (P&D) is pleased to present this report documenting the removal of underground fuel tanks, associated sample collection, over-excavation of petroleum hydrocarbon-impacted soil at the subject site, disposal of excavated soil, installation of portions of soil vapor and groundwater remediation systems, and the installation of a replacement underground storage tank system. This report is prepared in accordance with P&D's proposal 021093.P1 dated February 10, 1993. A Site Location Map is attached as Figure 1 and a Site Plan is attached as Figure 2.

It is P&D's understanding that K&B Environmental (K&B), formerly of Santa Clara, California prepared a Soil and Groundwater Remediation Workplan dated May, 1992 for the removal of the underground storage tanks and associated remediation activities. The workplan was approved by Mr. Scott Seery of the Alameda County Department of Environmental Health (ACDEH) in a letter dated June 4, 1992. It is also P&D's understanding that K&B installed portions of the remediation systems identified in the work plan which included vapor extraction probes, groundwater extraction wells, and associated piping. However, it is P&D's understanding that K&B was unable to complete a report documenting the field activities associated with the implementation of the workplan. P&D was subsequently requested by XTRA OIL Company to complete a report documenting the tank removal and remediation system installation activities. This report, discussing activities associated with the removal of the underground storage tanks from the site in 1992, was prepared by P&D with information provided to P&D from XTRA OIL Company.

SITE LOCATION/DESCRIPTION

The site is currently used as a gasoline station. Four 12,000 gallon underground fuel storage tanks are present at the site. Three of the tanks contain gasoline and the fourth tank contains diesel fuel. A 550 gallon waste oil tank was removed from the site in November, 1988.

The topography in the vicinity of the site is relatively flat, sloping slightly to the south-southwest. The site is bordered to the north by Castro Valley Boulevard, to the East by Redwood Road and to the South and West by a shopping center.

A former Chevron station is located approximately 600 feet west of the subject site on the south side of Castro Valley Boulevard. An active Unocal station is located approximately 700 feet to the north of the subject site on the west side of Redwood Road. It is P&D's understanding that a former Exxon station is located to the northeast of the subject site, approximately across Redwood Road from the presently active Unocal station. A BP station is located directly to the east of the subject site at the intersection of Redwood Road and Castro Valley Boulevard, on the east side of Redwood Road.

BACKGROUND

Three monitoring wells, designated as MW1, MW2 and MW3 were installed at the site on February 14 and 15, 1990 by Western Geo-Engineers. The subsurface materials encountered in the boreholes consisted primarily of silt and clay. The locations of the monitoring wells are shown in Figure 2. Soil samples collected during drilling of the boreholes for the monitoring wells revealed the presence of total petroleum hydrocarbons as gasoline (TPH-G) and total petroleum hydrocarbons as diesel (TPH-D). TPH-G was encountered in borehole MW1 at depths of 5 and 10 feet below grade at concentrations of 40 and 1,400 ppm, respectively; in borehole MW2 at depths of 10 and 15 feet below grade at concentrations of 230 and 95 ppm, respectively; and in borehole MW3 at depths of 5, 10 and 15 feet at concentrations of 140, 250 and 25 ppm, respectively. In addition, 120 ppm TPH-D was detected in borehole MW3 at a depth of 5 feet. Soil samples collected at a depth of 20 feet in borehole MW1 and at a depth of 18 feet in boreholes in MW2 and MW3 did not show any detectable concentrations of TPH-G or TPH-D. Groundwater was encountered in the boreholes at depths of approximately 15 to 16 feet below grade.

On February 15, 1990 Western Geo-Engineers drilled three exploratory boreholes at the site designated as SB1, SB2 and SB3. The subsurface materials encountered in the boreholes consisted primarily of silt and clay. The approximate locations of the boreholes are shown on Figure 2. It is P&D's understanding that soil samples were collected from the exploratory boreholes at depths of 10 and 12 feet and evaluated in the field using a photo ionization detector. In borehole SB1, TPH-G was detected at the depths of 10 and 12 feet at concentrations of 1,700 and 450 ppm, respectively. In boreholes SB2 and SB3, TPH-G was detected at the depths of 10 and 12 feet in both boreholes at concentrations of 800 ppm and greater than 2,000 ppm, respectively.

A groundwater monitoring and sampling program was initiated at the site on February 20, 1990. Groundwater flow direction has historically ranged from the east to the south-southeast at the subject site. The laboratory analytical results of the samples collected for the groundwater monitoring program are presented in the quarterly groundwater monitoring and sampling reports for the site.

FIELD ACTIVITIES

Tank Removal

It is P&D's understanding that Erickson, Inc. of Richmond, California cleaned the underground fuel tanks and removed approximately 1,400 gallons of rinseate from the tanks on July 15, 1992 in preparation for tank removal. The rinseate was hauled from the site by Erickson, Inc. with a uniform hazardous waste manifest to Gibson Oil/Pilot Petroleum of Redwood City, California. Erickson, Inc. is a California-registered hazardous waste hauler. Gibson Oil/Pilot Petroleum is a State-approved Transfer, Storage and Disposal Facility (TSDF) for oily liquids. A copy of the manifest for the rinseate is attached with this report.

It is P&D's understanding that Walton Engineering, Inc. (Walton) of West Sacramento, California removed the three 10,000-gallon capacity unleaded gasoline and the one 10,000-gallon capacity diesel fuel tanks from the site on July 16, 1992. The tanks were hauled by Erickson, Inc. to the Erickson, Inc. State-approved TSDF in Richmond for storage tank destruction. The construction of the tanks and the condition of the tanks at the time of removal are not known to P&D. Copies of the uniform hazardous waste manifests for the underground storage tanks are attached with this report. The former tank locations are shown in Figure 3.

It is P&D's understanding that on July 20, 1992 approximately 5,000 gallons of water was removed from the fuel tank pit by H&H Ship Service Company of San Francisco, California for interim remediation purposes. The water was hauled with a uniform hazardous waste manifest to the H&H Ship Service Company State-approved TSDF in San Francisco for disposal of the water. A copy of the uniform hazardous waste manifest is attached with this report.

Soil Sample Collection

It is P&D's understanding that following the removal of the underground fuel tanks, a total of 13 soil samples were collected from the fuel tank pit by K&B personnel on July 16, 1992. Review of the chain of custody documentation indicates that ~~samples were collected at a depth of approximately 10 feet~~; samples ~~collected at a depth of approximately 20 feet~~; and samples ~~collected at a depth of approximately 19 feet~~. Sample collection containers and procedures are not known to P&D.

It is P&D's understanding that on July ²⁹~~20~~, 1992 K&B personnel collected a total of 10 soil samples from beneath the ends of the pump islands. Review of the chain of custody documentation indicates that all of the soil samples were collected at a depth of approximately 2.5 feet. Sample collection containers and procedures are not known to P&D.

The sample collection locations for the former fuel tank pit and the dispenser islands are shown in Figure 4.

Fuel Tank Pit Over-Excavation Activities

It is P&D's understanding that based upon the laboratory analytical results, the former fuel tank pit and dispenser areas were over-excavated to remove petroleum hydrocarbon-impacted soil. The former fuel tank pit was reported to have been over-excavated to a depth of approximately 24 feet, except for an area in the middle of the former fuel tank pit which could not be reached by the excavator and which was reported to have been excavated to a depth of approximately 18 feet.

The vicinity of the former dispensers was reported to have been excavated to a depth of approximately 6 feet, except for a trench in this area which was reported to have been excavated to a depth of approximately 13 feet with a width of approximately 2 feet. The approximate dimensions and depths of over-excavation, including the excavation for the new tank pit are shown in Figure 5.

Stockpiled Soil Sample Collection

It is P&D's understanding that soil excavated from the old fuel tank pit, the new fuel tank pit, and from the vicinity of the dispensers was stockpiled on site on 10-millimeter thick sheets of visqueen. The soil was reported to have been covered with a 10-millimeter thick sheet of visqueen at the end of each day. Stockpiled soil samples were reported to have been collected into brass tubes and stored in a cooler on ice pending delivery to a State-certified laboratory, in accordance with disposal facility testing requirements.

On July 6, 1992 composite samples SPA, SPB and SPC were collected from stockpiled soil at the site. On July 9, 1992 composite samples SPD and SPE were collected from stockpiled soil at the site. On July 16, 1992 composite samples SPG and SPH were collected from stockpiled soil at the site. On July 24, 1992 composite samples SPJ and SPK were collected from stockpiled soil at the site.

GEOLOGY AND HYDROGEOLOGY

Based upon review of the files at the ACDEH for sites located in the vicinity of the subject site, the subsurface materials in the vicinity of the subject site are predominantly fine grained, with clay, silt and mixtures of silt and clay having been reported.

Based upon observation of a typical section exposed in the pit for the new underground storage tanks during a site visit on July 1, 1992 by P&D personnel, the subsurface materials consist of a fill layer approximately 2 feet in thickness which is underlain by a 3 to 4 foot thick layer of dark brown silty clay. This silty clay is in turn underlain by a light brown fine-grained material composed of clay and/or silt to the total depth explored of approximately 16 feet.

Based upon review of regional geologic maps (U.S. Geological Survey Open File Report 0-540, "Preliminary Geologic Map of the Hayward Quadrangle, Alameda and Contra Costa Counties, California" by Thomas W. Dibblee, Jr., 1980) the subject site is underlain by undifferentiated Quaternary alluvium (Qa). These alluvial materials are inferred to be underlain to an unknown depth by bedrock materials of the Upper Cretaceous Panoche Formation (Kp). The Panoche Formation is described as consisting of clayey shale with minor thin sandstone beds. The Panoche Formation outcrops in San Lorenzo Creek approximately 4,400 feet to the southeast of the site. Additionally, the inferred trace of the East Chabot Fault is situated approximately 1,800 feet to the southwest of the site.

LABORATORY RESULTS

Pit and Dispenser Samples

The soil samples collected from the former fuel tank pit and from beneath the dispensers on July 16 and July 30, 1992 were transported to McCampbell Analytical in Pacheco, California. McCampbell Analytical is a State-accredited hazardous waste testing laboratory. All of the soil samples collected from the former fuel tank pit were analyzed for TPH-G using EPA Method 5030 and Modified EPA Method 8015; BTEX using EPA Method 8020; and for TPH-D using EPA Method 3510 in conjunction with Modified EPA Method 8015. All of the soil samples collected from beneath the dispensers were analyzed for TPH-G and BTEX, and samples #5 through #10 (collected from beneath pump islands 3, 4 and 5) were analyzed for TPH-D.

The laboratory analytical results for the soil samples collected from the fuel tank pit showed TPH-G concentrations ranging from 12 to 350 ppm, except for samples #9, #10 and #11, which showed 1,100, 3,100 and 610 ppm, respectively. Similarly, TPH-D concentrations ranged from not detected to 280 ppm, except for samples #9, #10 and #11, which showed 640, 4,300 and 770 ppm, respectively.

The laboratory analytical results for the soil samples collected from beneath the ends of the fuel dispensers showed TPH-G ranging from 11 to 36, except for samples #7, #9 and #10 which showed 420, 320 and 1,500 ppm, respectively. Similarly, TPH-D concentrations ranged from 11 to 32 ppm, except for samples #7, #9 and #10 which showed 870, 1,600 and 6,000 ppm, respectively.

The laboratory analytical results of the soil samples collected from the former fuel tank pit are summarized in Table 1, and the laboratory analytical results of the soil samples collected from beneath the dispenser islands are summarized in Table 2. Copies of the laboratory analytical reports and chain of custody documentation are attached with this report.

Stockpiled Soil Samples

The soil samples collected from the soil stockpiles between July 6 and July 24, 1992 were transported to McCampbell Analytical in Pacheco, California. All of the soil samples collected from the soil stockpiles were analyzed for TPH-G using EPA Method 5030 and Modified EPA Method 8015; BTEX using EPA Method 8020; for TPH-D using EPA Method 3510 in conjunction with Modified EPA Method 8015; and for TPH-G and BTEX using the above methods on TCLP extracts (composite sample SPK did not have analysis performed for TCLP extract). In addition, composite samples SPA through SPG (all composite samples collected on July 6, 9 and 16, 1992) were analyzed for TPH-D using the above methods on TCLP extracts; and composite sample SPC was analyzed for Reactivity, Corrosivity and Ignitability (RCI).

The laboratory analytical results for the composite soil samples collected from the stockpiled soil showed non-TCLP TPH-G concentrations ranging from 5.8 to 67 ppm, and non-TCLP TPH-D concentrations ranging from 27 to 370 ppm, except for samples SPJ and SPK, which showed 1,500 and 2,000 ppm, respectively.

The laboratory analytical results for the composite soil samples collected from the stockpiled soil showed TCLP TPH-G concentrations ranging from not detected to 0.62 ppm, and TCLP TPH-D concentrations ranging from not detected to 0.81 ppm.

The non-TCLP laboratory analytical results of the soil samples collected from the stockpiled soil are summarized in Table 3, and the TCLP laboratory analytical results of the soil samples collected from the stockpiled soil are summarized in Table 4. Copies of the laboratory analytical reports and chain of custody documentation are attached with this report.

SOIL DISPOSAL

Based upon review of records, a total of fifteen 18-cubic yard capacity truckloads of soil were hauled to the BFI Vasco Road Sanitary Landfill in Livermore, California on each of June 11, 1992. On June 12, 1992, a total of 5 and 3 truckloads, respectively, were hauled to the Redwood Landfill in Novato, California. On June 13, 1992, a total of 3, 10 and 18 trucks, respectively, hauled soil from the excavations to the BFI facility. On each of June 14, 1992, a total of 11 trucks hauled soil from the excavations to the BFI facility.

A total of 91 trucks, each with a capacity of approximately 18 cubic yards, removed soil from the site. Approximately 1638 cubic yards of soil was hauled from the site to disposal facilities. Copies of the non-hazardous manifests for the BFI facility and copies of the invoices for the Redwood Landfill are attached with this report.

NEW TANK SYSTEM INSTALLATION

Four 12,000-gallon capacity underground fuel tanks were installed at the site. Three of the tanks presently contain unleaded gasoline and one of the tanks presently contains diesel fuel. It is P&D's understanding that specifications for the tank system were previously provided to the ACDEH by XTRA OIL Company for tank installation permitting purposes. The location of the new tanks is shown on Figure 6.

REMEDIATION SYSTEM INSTALLATION

It is P&D's understanding that following removal of the fuel tanks from the old tank pit, vapor extraction probes, groundwater extraction wells and associated piping were installed at the site by K&B personnel. A Site Plan

showing the locations where the vapor extraction probes and the groundwater extraction wells were installed is shown on Figure 7. A detail of the vapor extraction well and groundwater extraction well manifold system is attached with this report as Figure 8. A typical vapor extraction well diagram and a typical extraction well construction diagram supplied by K&B Environmental are attached with this report as Figures 9 and 10, respectively.

DISCUSSION AND RECOMMENDATIONS

Based on the laboratory analytical results of the soil samples collected from the walls of the fuel tank pit and from beneath the fuel pump islands, soil has been impacted by TPH-G, BTEX and TPH-D at the site. P&D recently conducted a groundwater quality investigation to evaluate the presence of petroleum hydrocarbons in groundwater in the vicinity of the site. P&D recommends that other potentially responsible parties in the vicinity of the subject site be contacted to determine if the extent of contamination detected in the vicinity of the site has been defined.

DISTRIBUTION

Copies of this report should be sent to Mr. Richard Hiatt at the Regional Water Quality Control Board, San Francisco Bay Region, and to Mr. Scott Seery at the ACDEH. Copies of the report should be accompanied by a transmittal letter signed by the principal executive officer of the XTRA OIL Company.

LIMITATIONS

This report was prepared solely for the use of XTRA OIL. The content and conclusions provided by P&D in this assessment are based on information collected during our investigation, which may include, but not be limited to, visual site inspections; interviews with the site owner, regulatory agencies and other pertinent individuals; review of available public documents; subsurface exploration and our professional judgement based on said information at the time of preparation of this document. Any subsurface sample results and observations presented herein are considered to be representative of the area of investigation; however, geological conditions may vary between borings and may not necessarily apply to the general site as a whole. If future subsurface or other conditions are revealed which vary from these findings, the newly-revealed conditions must be evaluated and may invalidate the findings of this report.

This report is issued with the understanding that it is the responsibility of the owner, or his representative, to ensure that the information contained herein is brought to the attention of the appropriate regulatory agencies, where required by law. Additionally, it is the sole responsibility of the owner to properly dispose of any hazardous materials or hazardous wastes left onsite, in accordance with existing laws and regulations.

This report has been prepared in accordance with generally accepted practices using standards of care and diligence normally practiced by recognized consulting firms performing services of a similar nature. P&D is not responsible for the accuracy or completeness of information provided by other individuals or entities which is used in this report. This report presents our professional judgement based upon data and findings identified in this report and interpretation of such data based upon our experience and background, and no warranty, either express or implied, is made. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur.

18. GENERATOR'S CERTIFICATION
I hereby declare that the contents of the consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable federal, state and international laws.
If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment. OR, if I am a small quantity generator, I have made a good faith effort to minimize or recycle generation and I have selected the waste management method that is available to me and that I can afford.
