San Lorenzo, California 94580

Subject: Disposal of Fuel-Affected Soils Stockpiled at the
Oro Loma Sanitary District Treatment Plant
2600 Grant Avenue
San Lorenzo, California

Dear Mr. Cortez:

Levine-Fricke has received analytical test results for soil samples collected from soils excavated, stockpiled and covered with plastic at the subject site. The two soil stockpiles are approximately 100 cubic yards each. One-four point composite soil sample was collected from each of the two stockpiles.

The composite soil samples were analyzed for total petroleum hydrocarbons as diesel (TPHd) by EPA method 3550, and the fuel-constituents benzene, toluene, ethylbenzene and total xylenes (BTEX) by EPA method 8020. Analytical tests detected 120 milligram per kilograms (mg/kg) of TPHd in soil sample SP-W-1,2,3,4 which was collected from the west stockpile, and 330 mg/kg of TPHd in soil sample SP-E-1,2,3,4 which was collected from the east stockpile. The BTEX compounds were not detected in either composite stockpile soil sample.

BFI Vasco Road Landfill, a class III solid waste disposal facility located in Livermore, California, generally accepts soil for disposal with TPHd below 1,000 ppm if BTEX results are low (or non-detect) and criteria tests for resistivity, corrosivity and ignitability (RCI) indicate that the soil is non-hazardous. It is our opinion that RCI results would indicate the material is non-hazardous and thus acceptable to BFI.

If you desire further information or would like us to obtain RCI results to facilitate disposal, please call me or John Sturman.

Sincerely,

Shellie Fletcher

DATE RECEIVED: 11/22/93

AEN JOB NO: 9311230

PROJECT SUMMARY:

On November 22, 1993, this laboratory received eight (8) soil samples.

Client requested the eight (8) samples be composited into two (2) samples and be analyzed for organic parameters. Sample identification, methodologies, results and dates analyzed are summarized on the following pages.

All laboratory quality control parameters were found to be within established limits. Batch QC data is included at the end of this report.

If you have any questions, please contact Client Services at (510) 930-9090.

**BROWNING-FERRIS INDUSTRIES**

Vasco Road Sanitary Landfill

November 26, 1993

Ora Loma Sanitary District
Attention: Mike Cortez

RE: Diesel Contaminated Soil

Dear Mike,

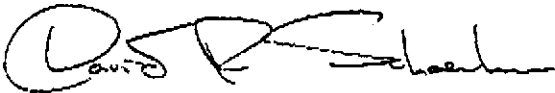

Thank you for your interest in BFI's waste disposal services. Browning-Ferris Industries' (BFI) Vasco Road Sanitary Landfill is pleased to quote a price of \$18.00 per cubic yard for the diesel contaminated soil at your district. Assuming that 3000 cubic yards are delivered within 60 days of approval, the \$18.00 rate will hold. Otherwise, the following schedule outlines job sizes and their respective charges.

0 - 500 cubic yards	=	\$22.00 per cubic yard
>500 - 1500 cubic yards	=	\$20.00
>1500 - 3000 cubic yards	=	\$19.00

All taxes are included in the listed costs, and there are no profiling fees. Transportation is not available through our facility; however, we would be pleased to suggest a few hauling companies.

BFI Vasco Road would like to express our appreciation for your interest in our disposal facility. If you should have any questions regarding our pricing structure, the contaminant thresholds, or our requirements for profiling, please feel free to contact me at (510) 447-0491.

Sincerely,

David P. Schoenherr
Technical Sales Representative

BFI Vasco Road Sanitary Landfill

Waste Characterization Requirements

For Petroleum Products

July 12, 1993

TABLE OF CONTENTS

- 1.0 Introduction
- 2.0 Required Information
- 3.0 Sample Collection & Analyses for Waste Disposal
- 4.0 Independent Laboratory Analyses
- 5.0 Threshold Values

1.0 INTRODUCTION

The purpose of this guidance manual is to assist generators with the proper characterization of petroleum based waste for disposal at the BFI Vasco Road Sanitary Landfill. This document is proprietary information and not for distribution other than by Browning-Ferris Industries, Inc. (BFI).

The BFI Vasco Road Sanitary Landfill is permitted as a Class III landfill and will not accept waste which is defined as hazardous by RCRA and/or CCR Title 22.

BFI will accept non-hazardous petroleum contaminated waste which has been properly sampled, analyzed and found to be acceptable for disposal. All requirements must be met in accordance with the Vasco Road Landfill Waste Discharge Requirements (WDR) and the procedures outlined in this document.

Waste acceptability is typically based on the soluble concentrations of individual compounds. Acceptance values have been calculated by using "The Designated Level Methodology for Waste Classification and Cleanup Level Determination" in conjunction with the most recent "Regional Water Quality Goals".

Final acceptance is based on BFI's determination that all necessary documentation has been reviewed. Once this determination is made, BFI will issue a unique 'Waste Code' number. This number should be included on the BFI Non-Hazardous Waste Manifests, which must accompany each delivery vehicle.

2.0 REQUIRED INFORMATION

To effectively determine landfill acceptability of a particular waste stream, the following information must be submitted to BFI:

- ♦ Completed "Waste Characterization Data Sheet" (WCD), and
- ♦ Requested Analytical Reports.

BFI may request additional information, which may be necessary depending upon the details of the specific project.

3.0 SAMPLE COLLECTION & ANALYSES FOR WASTE DISPOSAL

Sample collection and analyses must be performed in accordance with designated EPA procedures and methods. Field and laboratory sampling techniques and procedures are designed to provide representative samples. A representative sample is defined as a sample which can be expected to exhibit the average properties of the contaminated material.

BFI requires that all petroleum based material be analyzed prior to landfill disposal. BFI determines landfill compatibility based on the information supplied to BFI by the generator. It is the sole

responsibility of the generator to characterize a waste as non-hazardous pursuant to Federal, State and Local regulations. BFI requires waste characterization for landfill acceptability and will not assume responsibility for classifying a waste stream.

The following is a list of the required analyses for the listed contaminants.

**BFI VASCO ROAD SANITARY LANDFILL
REQUIRED ANALYTICAL DATA**

<u>CONTAMINANT</u>	<u>ANALYSES</u>
Gasoline	RCI TPH as Gasoline BTEX STLC/Pb
Diesel	RCI TPH as Diesel BTEX
Stoddard Solvent	RCI TPH as Stoddard Solvent 8240 (includes BTEX)
New Products	RCI TPH for Known Contaminant BTEX
Waste Oil	RCI TPH as Motor Oil STLC CAM 17 8240 (includes BTEX) 8270

RCI (Reactivity, Corrosivity, Ignitability) analyses are required for all incoming waste other than inert and municipal solid waste. The RCI analyses is used to determine whether or not a waste exhibits any hazardous characteristics as defined by 40 CFR parts 261.21, 261.22, and 261.23.

BTEX (Benzene, Toluene, Ethylbenzene, and Xylenes) analyses are required when characterizing petroleum contaminated soil. In cases where the product is known, BFI requests that the generator analyze the material for the known contaminant when analyzing for TPH (Total Petroleum Hydrocarbons). TRPH (Total Recoverable Petroleum Hydrocarbons by EPA Method 418.1) may be substituted for TPH when analyzing for high boiling point hydrocarbons (> C14). TPH as gasoline will be required in all cases where low to medium boiling point hydrocarbons are present (C2 through C12).

Soil contaminated with waste oil or an unknown hydrocarbon should be analyzed for Volatile Organic Compounds (Method No. 8240), Semi Volatile Organic Compounds (Method No. 8270) and STLC CAM 17 (The Waste Extraction Test (WET) for California Assessment Metals). These waste streams must also include the TRPH analysis.

Samples collected for TPH, BTEX and inorganic lead analyses may represent no more than 100 cubic yards of material. Samples collected and analyzed for STLC CAM 17, 8240, and 8270 may represent a maximum volume of 500 cubic yards. One RCI analysis will be required per profile and should be representative of the entire waste stream.

4.0 INDEPENDENT LABORATORY ANALYSES

The following should be considered when submitting data from an independent laboratory to BFI for review:

- ◆ All testing must be performed by a commercial laboratory certified by the State of California to perform the necessary tests.
- ◆ The analytical data must be less than one year old when received by BFI.
- ◆ The analytical report must be legible, typed on the laboratory letterhead, and include the address and phone number of the laboratory. No draft or preliminary reports will be acceptable. The data must be signed by a person of authority employed at the lab generating the data.
- ◆ The source and matrix of the waste sample must be identified on the laboratory report.
- ◆ The results must have units of measure identified.
- ◆ The data must be accompanied by a reference of the analytical methods employed.
- ◆ For results reported as "non detect", a detection or reporting level must be indicated. The detection level should be representative of the method used and the samples matrix analyzed. Laboratory detection limits must be less than BFI levels and regulatory levels in cases where a compound is not listed by BFI.
- ◆ Incomplete or inconsistent data received by BFI will result in a probable rejection of the information for waste evaluation purposes. To remedy this situation, BFI may request new, or additional, analytic information. Examples of inconsistencies are:
 - Required holding times not met
 - Required spike recoveries not reported nor the data bias corrected (QA/QC reports)
 - Reference to methodology not suitable for analysis
 - Required sample preservation not maintained
 - Chain of custody documentation unavailable

5.0 THRESHOLD VALUES

BFI prefers to receive analytical data which represents the contaminant in soluble concentrations (excluding TPH analyses). BFI will only accept material which is represented by analytical results indicating concentrations below the listed threshold values. In the event total thresholds are met and the soluble thresholds are exceeded, BFI will base landfill acceptability on soluble concentrations.

In many instances, stockpile sampling may have previously been performed and analyzed for total concentrations rather than soluble concentrations. BFI will consider basing approvals solely on total results where the total concentration of a particular compound does not equal or exceed 20 (TCLP dilution factor) or 10 (STLC dilution factor) times the BFI listed soluble threshold for organic and inorganic compounds, respectively. Keep in mind that these equations are conservative, and will provide the maximum leaching potential of a compound. The equations do not consider the ability of the material to chemically bind the compound.
