Subject: Groundwater Monitoring Report, Fall Semiannual 2004 Sampling Event, Municipal Service Center, 7101 Edgewater Drive, Oakland, California

Dear Mr. Ojukwu:

LFR Levine·Fricke (LFR) is pleased to present this semiannual groundwater monitoring report summarizing data collected during the fall 2004 semiannual groundwater monitoring event at the Municipal Service Center, located at 7101 Edgewater Drive in Oakland, California ("the Site"). These activities were performed in accordance with previous sampling events conducted at the Site.

If you have any questions regarding this report, please contact the undersigned.

Sincerely,

Larry Lapuyade
Senior Project Geologist

1.0 INTRODUCTION

This report presents the results of the fall 2004 semiannual groundwater monitoring event conducted from October 27 through October 29, 2004 at the Municipal Service Center (MSC), located at 7101 Edgewater Drive in Oakland, California ("the Site"; Figure 1). LFR Levine·Fricke (LFR) conducted monitoring activities at the Site in accordance with Assignment No. GO3-LFR-20. Described below are the monitoring activities, analytical results, distribution of contaminants in groundwater, conclusions, recommendations, and anticipated annual spring 2005 monitoring activities tentatively scheduled for April/May 2005.

2.0 SITE BACKGROUND AND CORRECTIVE ACTION MEASURES

Eighteen 4-inch-diameter and four 2-inch-diameter test/observation wells were installed on site to depths ranging from 13 feet below ground surface (bgs) to 17 feet bgs, in December 2001 and January 2002, according to Uribe & Associates Test/Observation Well Installation Report U & A Project 291-03, prepared in April 2002 (Uribe 2002). Seven wells (RW-A1, RW-A2, OB-A1, RW-B1, RW-B2, RW-B3, and RW-B4) were installed in the vicinity of Plumes A and B. Fifteen wells (RW-C1, RW-C2, RW-C3, RW-C4, RW-C5, RW-C6, RW-C7, OB-C1, RW-D1, RW-D2, RW-D3, RW-D4, RW-D5, OB-D1, and OB-D2) were installed in the vicinity of plumes C and D. Every well, except OB-A1, was surveyed subsequent to the installation event.

According to a Second Quarter 2003 Monitoring Report (Uribe 2003), approximately 10,000 gallons of a groundwater/free product mixture were removed from on-site wells RW-B3 and RW-B4 (Plume B) in September and October 2002, using a trailer-mounted, dual-phase extraction unit with a 10-HP vacuum pump. Additionally, approximately 10,000 gallons of liquid were removed from wells RW-C3, RW-C4, RW-C5, and RW-C7 (Plume C) through five daily extractions over a two-month period. The liquid was pumped into a 21,000-gallon aboveground storage tank to allow oil/water separation and drained through three 2,000-pound granular-activated carbon filters (in series). After filtration, the wastewater was discharged into a local storm drain. A National Pollutant Discharge Elimination System (NPDES) permit was issued prior to discharge.

Within the same time period, hydrogen peroxide, followed by water, was injected biweekly into wells OB-A1, RW-A1, RW-A2, TBW-3, and TBW-4 (Plume A); MW-16 and MW-17 (Plume B); and MW-5 in the active tank area, to promote in-situ bioremediation.

3.0 FALL 2004 SEMIANNUAL MONITORING ACTIVITIES

3.1 Field Activities

The field activities of depth to water/product measurement and well sampling were conducted in accordance with the City of Oakland MSC Schedule and Protocol Table presented in Appendix A.

On October 27, 2004, LFR personnel measured depth to water and depth to separate phase hydrocarbons (SPH) using an electric oil/water interface probe in the following wells: MW-1 through MW-7, MW-10 through MW-17, TBW-1 through TBW-6, RW-A1, RW-A2, OB-A1, RW-B1 through RW-B4, RW-C1 through RW-C7, OB-C1, RW-D1 through RW-D5, OB-D1, OB-D2, and RW-1. The oil/water interface probe was decontaminated with hexanol and rinsed with distilled water before use in each well. Current and historical product thickness measurements, depth-to-groundwater measurements, and groundwater elevations calculated from groundwater measurements are presented in Table 1.

On October 8, 2004, LFR met with a representative from OTG EnviroEngineering to assess well locations. At that time, wells MW-8 and MW-9 could not be located. LFR subsequently used a metal detector to search for the two wells before conducting sampling activities. It is assumed that either the metal well boxes have been destroyed or the wells have been buried deeper than 1 foot bgs.

On October 28 and 29, 2004, LFR personnel collected groundwater samples from wells MW-1, MW-5, MW-10, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-17. MW-6 was not sampled due to the presence of SPH, and wells MW-8 and MW-9 could not be located. Using a clean disposable Teflon bailer for each well, a minimum of three well-casing volumes of water were purged from each of the nine on-site wells prior to the collection of groundwater samples. The wells were allowed to recover to at least 80 percent of their original static groundwater levels before sampling. Dissolved oxygen, temperature, pH, and conductivity were measured for each well volume purged. Additionally, characteristics of the water (color, turbidity, odor, sheen) were noted on the field data sheets, which are included in Appendix B.

Subsequent to purging, samples were collected using the disposable polyvinyl chloride, bottom-discharging bailer used to purge the well. The samples were transferred from the bailer to the appropriate sample containers, labeled, and placed in a "wet chilled" cooler containing ice under chain-of-custody protocol. The samples were secured in the cooler and transferred to Curtis & Tompkins, Ltd., Analytical Laboratories (C&T), located in Berkeley, California. Purged and decontamination water generated during sampling activities were transferred into an on-site Baker Tank that was part of the on-site extraction and treatment system maintained by the City of Oakland.

3.2 Sample Analyses

The groundwater samples were analyzed by C&T, a California Department of Health Services–certified environmental laboratory, for the following parameters:

- Total petroleum hydrocarbons (TPH) as gasoline (TPH-g), kerosene (TPH-k), diesel (TPH-d), and motor oil (TPH-mo) using U.S. Environmental Protection Agency (U.S. EPA) Method 8015B, using a silica gel cleanup.
- Benzene, toluene, ethylbenzene, and total xylenes (collectively known as BTEX) and methyl tertiary-butyl ether (MTBE) using U.S. EPA Method 8260B.

4.0 MONITORING RESULTS

4.1 Shallow Groundwater Topography

Depth to groundwater measurements were collected on October 27, 2004, using a Solinst oil/water interface meter (Table 1). Prior to groundwater measurement, the well caps were removed from all the wells to relieve atmospheric pressure and promote equilibrium in the groundwater column within each well. Groundwater levels were allowed to equalize prior to groundwater measurement. Groundwater elevations were determined using well survey data from the Second Quarter 2003 Monitoring Report, City of Oakland Municipal Service Center (Uribe 2003). Groundwater elevations ranged from 6.60 feet mean sea level (msl) at TBW-5 to 1.54 msl at MW-17 (Figure 2). A lower groundwater elevation was measured at adjacent monitoring well MW-16 (0.25 msl); however, this elevation is considered anomalous and was not used for contouring. MW-16 and MW-17 are located adjacent to the bay, with MW-17 located farther downgradient. Groundwater flow direction, measured between wells TBW-5 and MW-13, is toward the west in the northern section of the Site at 0.03 foot/foot (ft/ft), and toward the southwest (measured between wells MW-6 and MW-17) at 0.017 ft/ft in the southern portion of the Site. A groundwater high was observed in the vicinity of TBW-3,which is potentially created by the higher permeability of the backfill in the area. The variation in the groundwater gradient may be due to differences in lithologic characteristics in the subsurface, preferential pathways (possibly due to backfilled utility trenches and underground storage tank pits). The groundwater flow direction for this sampling period was similar to that reported by Ninyo & Moore in its July 14, 2004 Spring Semiannual Monitoring Report for the Site.

4.2 Occurrence of Separate-Phase Hydrocarbons

SPH was observed in the following on-site wells: MW-6, RW-C2, RW-C5, RW-D1, RW-D2, RW-D3, RW-D4, and RW-D5. SPH thickness was measured in on-site monitoring wells RW-C8 (0.15 foot) and OB-C1 (1.08 feet). Sheen was noted in wells TBW-3 and TBW-4, and a strong odor was noted in well OB-A1. These results are presented in Table 1. The observation of SPH in these wells was similar to previous

sampling events. SPH was previously noted in wells TBW-5, RW-B3, and RW-C4 during the April 2004 sampling event, but was not present in these wells during the October 2004 sampling event.

4.3 Contaminant Distribution in Groundwater

The analytical data from this groundwater monitoring event are provided in Table 1 along with historical analytical results. Laboratory analytical data reports are included in Appendix C. Historical data for volatile organic compounds, semivolatile organic compounds, Leaking Underground Fuel Tank metals, and other metals are provided in Tables 2, 3, 4, and 5, respectively.

For quality assurance/quality control (QA/QC), LFR collected a duplicate sample from well MW-14 and analyzed it for TPH-g, TPH-k, TPH-d, TPH-mo, BTEX, and MTBE. Analytical results in this duplicate sample were very close to the analytical results for sample MW-14.

4.3.1 Benzene

Benzene concentrations detected above laboratory analytical detection limits (LADL) were reported in groundwater samples collected from 5 of the 10 monitoring wells sampled. The maximum benzene concentration reported from groundwater samples collected this monitoring event was 18 micrograms per liter (µg/l) in wells MW-5 and MW-16. Historically, concentrations of benzene in well MW-5 have been as high as 2,100 µg/l. Free product has historically been detected in well MW-16.

In its July 2004 monitoring report (Ninyo & Moore 2004), Ninyo & Moore cited the following regulatory standards for benzene: acceptable risk threshold for the San Francisco Airport Ecological Protection Zone (SFAEPZ) Tier I Standard was 71 µg/l; the City of Oakland Tier I Carcinogenic Risk-Based Standard Level (RBSL) was also 71 µg/l. However, LFR has not included City of Oakland RBSLs in this report because they are from 1999 and are considered out of date; the San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for Surface Water Bodies in a Marine Environment for benzene is 71 µg/l (RWQCB 2003; Table F-2b). Benzene concentrations at the Site for this sampling event are well below these levels and do not pose an inhalation risk to human health.

Benzene was also reported in groundwater samples collected from wells MW-1 (6.4 µg/l), MW-7 (1.6 µg/l), and MW-14 (1.9 µg/l). These concentrations are generally consistent with historical concentrations for these wells and are below the above-referenced standards.

4.3.2 Toluene

Toluene was reported at very low concentrations in 3 of the 10 wells sampled: wells MW-1 (0.6 µg/l), MW-5 (2.1 µg/l), and MW-16 (1.7 µg/l). Concentrations are well below regulatory action levels for toluene of 40 µg/l (RWQCB ESLs).

4.3.3 Ethylbenzene

Ethylbenzene concentrations were reported in groundwater samples collected from 2 of the 10 wells sampled. Concentrations of ethylbenzene were 280 µg/l in well MW-5 and 29 µg/l in well MW-16. These concentrations are similar to historical concentrations of ethylbenzene in these wells and are below the SFAEPZ Tier I Standard (29,000 µg/l), but exceeded the RWQCB ESLs for Surface Water Bodies in a Marine Environment of 30 µg/l (RWQCB 2003).

4.3.4 Total Xylenes

Total xylenes were reported in groundwater samples collected from 4 of the 10 monitoring wells sampled. The maximum concentration of total xylenes was 16.1 µg/l in a groundwater sample collected from well MW-5. This maximum concentration slightly exceeds the RWQCB ESLs for Surface Water Bodies in a Marine Environment for total xylenes (13 µg/l).

Total xylenes were also reported in samples collected from wells MW-1 (1.4 µg/l), MW-15 (2.2 µg/l), and MW-16 (1.7 µg/l). These concentrations are consistent with historical concentrations for these wells and are below RWQCB ESLs.

4.3.5 MTBE

MTBE concentrations above LADL were reported in groundwater samples collected from 1 of the 10 monitoring wells sampled. MTBE was detected at 94 µg/l in a sample from well MW-5. This concentration is below historical concentrations previously detected in this well. This concentration is below the RWQCB ESLs for Surface Water Bodies in a Marine Environment for MTBE (180 µg/l). MTBE has historically been at or below LADL in the wells sampled during this sampling event.

4.3.6 TPH-g

TPH-g was reported in groundwater samples collected from 5 of the 10 wells sampled. The maximum TPH-g concentration reported for this groundwater monitoring event was 3,000 µg/l in the groundwater sample collected from well MW-5. This concentration is within recent historical concentrations for this well. It is below the SFAEPZ Tier I Standard Acceptable Threshold of 3,700 µg/l for TPH-g (Ninyo & Moore 2004), and below the RWQCB ESLs for Surface Water Bodies in a Marine Environment for TPH-g, which is also 3,700 µg/l.

TPH-g was also detected in wells MW-1 (340 µg/l), MW-12 (170 µg/l), MW-14 (53 µg/l) and MW-16 (1,100 µg/l). Well MW-16 has only been sampled one other time due to the presence of free product. Concentrations of TPH-g from wells MW-1 and MW-12 appeared to be due to heavier hydrocarbons based upon laboratory analytical caveats and are most likely due to TPH-k. Concentrations of TPH-g are consistent with historic concentrations for these wells and are below the SFAEPZ Tier I Standard Acceptable Threshold for TPH-g and the RWQCB ESLs for Surface Water Bodies in a Marine Environment for TPH-g.

4.3.7 TPH-d

TPH-d was reported in groundwater samples collected from 4 of the 10 monitoring wells sampled. The maximum concentration of TPH-d was 840 µg/l in a groundwater sample collected from well MW-5. This concentration exceeds both the SFAEPZ Tier I Standard Acceptable Threshold for TPH-d (middle distillates) of 640 µg/l g and the RWQCB ESLs for Surface Water Bodies in a Marine Environment for TPH-d (middle distillates) of 640 µg/l.

TPH-d was also detected in wells MW-1 (230 µg/l), MW-12 (240 µg/l), and MW-16 (450 µg/l). Laboratory analytical notes indicate that all four concentrations are most likely due to lighter hydrocarbons (i.e., TPH-k) and are not TPH-d.

4.3.8 TPH-mo

TPH-mo was reported in groundwater samples collected from 1 of the 10 wells sampled. TPH-mo was detected at 460 µg/l in a sample from well MW-12.This concentration is below both the SFAEPZ Tier I Standard Acceptable Threshold for TPH-mo of 640 µg/l (middle distillates; Uribe 2003) and the RWQCB ESLs for Surface Water Bodies in a Marine Environment for residual fuels, which is also 640 µg/l (middle distillates). This concentration is consistent with historical concentrations of TPH-mo in this well.

4.3.9 TPH-k

TPH-k was detected in 4 of the 10 wells sampled. Concentrations ranged from 180 µg/l to 940 µg/l. The concentration of TPH-k in well MW-5 was 940 µg/l, which was above both the SFAEPZ Tier I Standard Acceptable Threshold for TPH-k (middle distillates) of 640 µg/l and the RWQCB ESLs for Surface Water Bodies in a Marine Environment for TPH-k of 640 µg/l. The remaining concentrations of TPH-k were 240 µg/l in well MW-1, 180 µg/l in well MW-12, and 480 µg/l in well MW-16. These concentrations are consistent with historical TPH-k concentrations in these wells.

4.4 Laboratory Analysis

Current laboratory analytical results and historical results are presented in Table 1. Copies of laboratory data sheets and chain-of-custody documents are included in Appendix C.

5.0 LABORATORY QUALITY ASSURANCE AND QUALITY CONTROL

A laboratory QA/QC review was performed on the laboratory analytical data to evaluate the quality and usability of the analytical results. The following sections summarize the QA/QC review.

5.1 Method Holding Times

Extraction and analyses performed on the collected samples were reviewed by LFR personnel and were found to be within the appropriate holding times.

5.2 Blanks

One trip blank (TB-2) was prepared by C&T, transported along with groundwater samples, and analyzed for TPH-g using EPA Method 8015B. Additionally, laboratory method blank results were reviewed for detection of target analytes. No target analytes were detected in TB-2 or in method blanks, indicating that transportation and laboratory procedures were not a source of contamination.

5.3 Laboratory Control Samples

Laboratory Control Samples and MS, MSD and BS, BSD were conducted by C&T for TPH-g, TPH-d, TPH-k, TPH-mo, and BTEX. All samples were within the percentage recovery range required by the laboratory.

5.4 Surrogates

All surrogates, including hexacosane, bromofluorobenzene, and trifluorotoluene for TPH-g, TPH-d, TPH-k, and TPH-mo, and bromofluorobenzene, 1,2-Dichloroehtane-d4, and toluene-d8 for BTEX were used for laboratory QA/QC analysis. All surrogates were within the laboratory recovery limits.

5.5 False-Positive Petroleum Hydrocarbon Identification

Qualifiers were reported in the laboratory analytical reports as noted in previous sections.

6.0 CONCLUSIONS AND RECOMMENDATIONS

- Groundwater elevations ranged from 1.54 feet msl at well MW-17 to 6.60 feet msl at well TBW-3. The direction of shallow groundwater flow is toward the west in the northern section of the site at a 0.03 ft/ft gradient and toward the southwest at 0.017 ft/ft in the southern portion of the Site. A shallow groundwater high was observed in the vicinity of well TBW-3. This groundwater high is probably the result of higher subsurface permeability in areas of excavation backfill.
- SPH was observed in 10 wells. The maximum product thickness measured was 1.08 feet in well OB-C1.
- Benzene was detected above laboratory analytical detection limits in 5 of 10 wells sampled. The maximum concentration of benzene detected in shallow groundwater was 18 µg/l in wells MW-5 and MW-16. This concentration is well below both the SFAEPZ threshold and RWQCB ESLs for Surface Water Bodies in a Marine Environment of 71 µg/l.
- MTBE was detected above laboratory analytical detection limits in 1 of 10 wells sampled. The maximum concentration of MTBE detected in shallow groundwater was 94 µg/l in well MW-5. This concentration is below the RWQCB ESL for Surface Water Bodies in a Marine Environment for MTBE of 180 µg/l.
- TPH-g was detected in 5 of 10 wells sampled. The maximum concentration of TPH-g detected in shallow groundwater was 3,000 µg/l in well MW-5. This concentration is below both the SFAEPZ acceptable threshold and RWQCB ESL for middle petroleum distillates of 3,700 µg/l. Two of the detections of TPH-g were likely TPH-k and not TPH-g, according to the analytical laboratory.
- TPH-k was detected in 4 of 10 wells sampled. The maximum concentration of TPH-k was 940 µg/l in shallow groundwater in well MW-5. This concentration is above both the SFAEPZ acceptable threshold and RWQCB ESL for middle petroleum distillates of 640 µg/l. Other detected TPH-k concentrations were below 640 µg/l.
- TPH-mo was detected in 1 of 10 wells sampled at a concentration of 460 µg/l in well MW-12. This concentration is below both the SFAEZP acceptable threshold and RWQCB ESL for middle petroleum distillates of 640 µg/l.
- TPH-d was detected in 4 of 10 wells sampled. The maximum concentration of TPH-d was 840 µg/l in well MW-5. This concentration exceeds both the SFAEZP acceptable threshold and the RWQCB ESL for middle petroleum distillates of 640 µg/l. Other detected concentrations of TPH-d were below 640 µg/l. Based on discussions with the analytical laboratory, the analytical results indicated that all four detections of TPH-d were likely due to lighter hydrocarbons as TPH-k.
- Petroleum hydrocarbon concentrations appear to be decreasing, probably due to biodegradation.

Based on the results of the fall 2004 groundwater monitoring event, LFR has the following recommendations:

- Groundwater monitoring should continue on site due to the elevated concentrations of TPH-g, TPH-k, BTEX, and MTBE reported during this monitoring event.
- Groundwater monitoring wells not located during this sampling event (MW-8 and MW-9) should be located for future groundwater monitoring events.
- Conduct a conduit study to evaluate potential contaminant flow pathways for SPH and dissolved-phase hydrocarbons toward the San Leandro Bay. If the results of the conduit study indicate a preferential pathway to the bay, collect sediment samples at the bay shoreline to assess potential contamination migrating from the Site toward the shoreline.
- Following the conduit study and sediment sampling, evaluate the need for an ecological risk assessment (EA). The EA would consist of biological characterization, chemical characterization, and an exposure pathways assessment. The objectives of the EA would be to identify potential species of concern and significant habitats that may exist at the Site or in areas affected by the Site, and any actual or potentially complete exposure pathways.
- Continue in-situ remediation using hydrogen peroxide.

7.0 LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No other warranty, expressed or implied, is made regarding the professional opinions presented in this report. Please note this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site can change with time as a result of natural processes or the activities of man at the site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which LFR has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. LFR should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

Table 1
Summary of Groundwater Analytical Data, Petroleum Hydrocarbons
Municipal Service Center
7101 Edgewater Drive, Oakland, California

Concentrations expressed in micrograms per liter (µg/l)

Well ID/ Date	TOC Elevation (in feet)	Depth to Groundwater (in feet)	Groundwater Elevation (in feet)	BTEX Method	Notes	TPH-d (µg/l)	TPH-mo (µg/l)	TPH-k (µg/l)	TPH-g (µg/l)	Benzene (µg/l)	Toluene (µg/l)	Ethyl-benzene (µg/l)	Total Xylenes (µg/l)	MTBE (µg/l)

Notes:

Groundwater elevations corrected for the presence of free product according to the calculation: GW Elevation = TOC - DTW + (0.8 x SPH thickness)

--- = Not measured/analyzed
BTEX = Benzene, toluene, ethylbenzene, and xylenes by EPA Method 8020, or 8240/8260.
DTW = Depth to water
Dup = Duplicate sample
Filtered = Groundwater samples were filtered through a 0.45 micron glass membrane filter
ID = Identification
MTBE = Methyl tertiary butyl ether by EPA Method 8020 or 8260. Confirmation 8260 results shown in parantheses.
NM = Not measured. Well obstructed or could not be located.
SPH = Separate-phase hydrocarbons; measured thickness
SGC = Silica gel cleanup based on Method 3630B prior to TPH-d, TPH-k, or TPH-mo analysis, following CRWQCB February 16, 1999 memorandum
TBW = Tank backfill well
TOC = Top of casing
TPHd = Total petroleum hydrocarbons quantitated as diesel - analyzed by EPA Method 8015B
TPHg = Total petroleum hydrocarbons quantitated as gasoline - analyzed by EPA Method 8015B
TPHk = Total petroleum hydrocarbons quantitated as kerosene - analyzed by EPA Method 8015B
TPHmo = Total petroleum hydrocarbons quantitated as motor oil - analyzed by EPA Method 8015B

a = The analytical laboratory reviewed the data and noted that petroleum hydrocarbons quantified in the diesel range actually resemble heavier fuels at the front end of the motor oil pattern
b= The analytical laboratory reviewed the data and noted that petroleum hydrocarbons quantified in the diesel range actually resemble lighter fuels; the response looks like lower carbon chain compounds close to the gasoline range
c= The analytical laboratory reviewed the data and noted that the sample exhibits a fuel pattern which does not resemble the standard
e= Results are estimated due to concentrations exceeding the calibration range
f= Filtration with 0.45 micron glass membrane filter and silica gel treatment
g= Depth to product, depth to water could not be determined
h= The analytical laboratory reviewed the data and noted that petroleum hydrocarbons quantified in the motor oil range are actually from the front end of the kerosene oil pattern.
i= The analytical laboratory reviewed the data and noted that petroleum hydrocarbons quantified in the motor oil range are actually from the back end of the kerosene oil pattern.
j= The analytical laboratory reviewed the data and noted that the sample exhibited an unknown peak or peaks.
J= Value qualified as "estimated"
L= Lighter hydrocarbons contributed to the quantitation
Y= Sample exhibits chromatographic pattern which does not resemble standard
B= Results flagged with "B" indicate motor oil was detected in the method blank
Z= Sample exhibits unknown single peak or peaks
H= Heavier hydrocarbons contributed to the quantitation.

Table 2
Summary of Groundwater Analytical Data, VOCs
Municipal Service Center, 7101 Edgewater Drive, Oakland, California

Concentrations expressed in micrograms per liter (µg/l)

Well ID/ Date	Benzene (µg/l)	n-Butyl-benzene (µg/l)	sec-Butyl-benzene (µg/l)	tert-Butyl-benzene (µg/l)	Chloro-ethane (µg/l)	Chloro-form (µg/l)	Methyl Chloride (µg/l)	1,2-DCA (µg/l)	cis-1,2-DCE (µg/l)	1,2-DCP (µg/l)	Ethyl-benzene (µg/l)	Isopropyl-benzene (µg/l)	p-Isopropyl-toluene (µg/l)	MTBE (µg/l)	Napthalene (µg/l)	n-Propyl-benzene (µg/l)	Toluene (µg/l)	1,2,4-TMB (µg/l)	1,3,5-TMB (µg/l)	Xylenes (µg/l)

Notes:

E = estimated concentration
µg/l = micrograms per liter
MTBE = methyl tertiary-butyl ether
ND = Not detected.
VOCs = Volatile organic compounds by EPA Method 8260. Sample not subject to silica gel cleanup or filtration prior to analysis.
1,2-DCA = 1,2-dichloroethane
1,2-DCP = 1,2-dichloropropane
1,2,4-TMB = 1,2,4-trimethylbenzene
1,3,5-TMB = 1,3,5-trimethylbenzene

Table 3
Summary of Groundwater Analytical Data, SVOCs
Municipal Service Center, 7101 Edgewater Drive, Oakland, California

Concentrations expressed in micrograms per liter (µg/l)

Well ID/ Date	Napthalene (µg/l)	Pyrene (µg/l)	Other SVOCs (µg/l)

COOLER RECEIPT CHECKLIST

Login#: 175646 Date Received: 10/29/04 Number of Coolers: 1
Client: LFR Project: OAKLAND Edgewater

A. Preliminary Examination Phase
Date Opened: 10/29/04 By (print): Peter P. (sign) [signature]

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... YES NO
   Type of ice: WET Temperature: On ice

B. Login Phase
Date Logged In: 10/29/04 By (print): Peter P. (sign) [signature]

1. Describe type of packing in cooler: Zip Lock bag
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... (YES) NO
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... (YES) NO
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____
