Re: **Quarterly Groundwater Monitoring Report – Third Quarter 2015**  
German Autocraft, 301 East 14<sup>th</sup> Street, San Leandro, California  
Fuel Leak Case No. RO0000302; Global ID T0600100639

Dear Mr. Detterman:

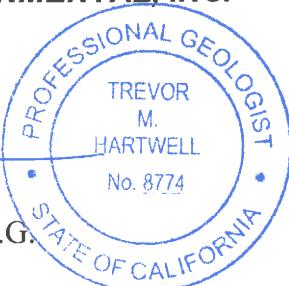

Stratus Environmental, Inc. (Stratus) is submitting the attached report presenting a summary of work performed at the site during the third quarter 2015 on behalf of Mr. Seung Lee for the German Autocraft facility, located at 301 East 14<sup>th</sup> Street, San Leandro, California. Stratus representatives, whose signatures appear below, declare under penalty of perjury, that the information contained in the attached report are true and correct to the best of our knowledge.

If you have any questions regarding this project, please contact Trevor Hartwell at (530) 313-9966.

Sincerely,

**STRATUS ENVIRONMENTAL, INC.**

  
Trevor M. Hartwell, P.G.  
Project Manager

Gowri S. Kowtha, P.E.  
Principal Engineer

Attachment: Quarterly Groundwater Monitoring Report, Third Quarter 2015

          Mr. Ramirez

## GERMAN AUTOCRAFT FACILITY QUARTERLY GROUNDWATER MONITORING REPORT

Facility Address: 301 East 14<sup>th</sup> Street, San Leandro, California  
Consulting Co./Contact Person: Stratus Environmental, Inc. / Trevor Hartwell  
Consultant Project No: 2076-0301-01  
Primary Agency/Regulatory ID No: Mr. Mark Detterman, Alameda County Environmental Health Department (ACEHD) Fuel Leak Case No. RO0000302; Global ID T0600100639

### **WORK PERFORMED THIS PERIOD (Third Quarter 2015):**

1. On August 12, 2015, Stratus conducted semi-annual groundwater monitoring and sampling activities at the site. During this event, groundwater monitoring wells MW-2, MW-3, MW-5, MW-8 through MW-15, and MW-1A were gauged for depth to water and evaluated for the presence of free product. Well MW-5 was dry during the sampling event and therefore was not sampled. Following gauging, the monitoring wells were purged and groundwater samples were collected. In addition to the monitoring wells, the domestic well located at 141 Farrelly was also sampled. All groundwater samples were forwarded to a state-certified analytical laboratory for analysis. Well construction details are summarized in Table 1. Tabulated historical groundwater elevation and analytical results are summarized in Table 2.

### **WORK PROPOSED FOR NEXT PERIOD (Fourth Quarter 2015):**

1. In accordance with ACEHD correspondence dated February 11, 2015, groundwater monitoring and sampling activities will occur on a quarterly basis to more quickly determine groundwater trends. The next groundwater monitoring event is scheduled for November 2015.

Current Phase of Project: Remedial Selection / Interim Remedial Action (RS/IRA)  
Frequency of Groundwater Monitoring/  
Sampling: MW-2, MW-3, MW-5, MW-8, MW-9, MW-10, MW-11, MW-12, MW-13,  
MW-14, MW-1A, 141 Farrelly = All Wells Quarterly  
Groundwater Sampling Date: August 12, 2015  
Is Free Product (FP) Present on Site: No  
Approximate Depth to Groundwater: 26.31 to 28.48 feet below top of well casing  
Groundwater Flow Direction: West  
Groundwater Gradient: Between 0.0016 and 0.003 ft/ft

## DISCUSSION:

Stratus conducted semi-annual groundwater monitoring and sampling activities on August 12, 2015. During this event, all monitoring wells (MW-2, MW-3, MW-8 through MW-15, and MW-1A) were gauged for depth to water, purged, and sampled. Well MW-5 was dry during the sampling event and therefore was not sampled. In addition to the monitoring wells, the domestic well located at 141 Farrelly was also sampled. Groundwater samples were analyzed at a state-certified analytical laboratory for gasoline range organics (GRO) by EPA Method SW8015B/SW8260B, and for benzene, toluene, ethylbenzene, total xylenes (BTEX compounds), and for methyl tert-butyl ether (MTBE) by EPA Method SW8260B. Field data sheets, sampling procedures, and laboratory analytical reports are included as Attachments A, B, and C respectively. Groundwater elevation data and analytical results are summarized in Table 2. Analytical results of sampled wells and depth to groundwater measurements have been uploaded to the State of California's GeoTracker database. Documentation of these data uploads is attached in Appendix D.

Twelve groundwater monitoring wells (MW-2, MW-3, MW-5, MW-8 through MW-15, and MW-1A) are installed to depths ranging from approximately 30 to 40 feet below ground surface (bgs) and monitor groundwater occurrence and quality in the uppermost water-bearing zone beneath the site. On December 9, 2014, the newly installed monitoring well (MW-15) was surveyed and all other monitoring wells (MW-2, MW-3, MW-5, MW-8 through MW-14, and MW-1A) were resurveyed. At the time of the third quarter 2015 monitoring event, depth to water in all gauged wells had decreased between 0.13 to 1.38 feet since the previous monitoring event (May 28, 2015). Groundwater elevation measurements were converted to feet above mean sea level (MSL) and used to construct a groundwater elevation contour map (Figure 3). The groundwater flow direction was generally to the west with a calculated gradient between 0.0016 ft/ft and 0.003 ft/ft. Although the groundwater flow direction varies predominantly between west and southwest, variations to the west-northwest and south-southwest have been observed (Figure 6).

Groundwater beneath the site is impacted with GRO and BTEX. During the third quarter 2015 sampling event, concentrations of GRO were reported in eight of the twelve sampled wells. Seven wells showed an increase in concentrations (MW-2, MW-3, MW8, MW-9, MW-10, MW-12, and MW-1A), one showed a decrease and three wells remained stable. The highest concentration of GRO was reported in well MW-15 at (38,000 µg/L). Benzene was reported in wells MW-9 (2.4 µg/L), MW-10 (100 µg/L), MW-12 (12.0 µg/L), and MW-15 (110 µg/L). Concentrations of GRO and BTEX were reported at historical lows in well MW-15 since installation of the well on September 25, 2014. Three wells showed an increase (MW-9, MW-10, and MW-12), and seven wells reported concentrations below lab reporting limits, and remained stable. An iso-concentration map illustrating GRO concentrations is included as Figure 4. An iso-concentration map illustrating benzene concentrations is included as Figure 5.

## RECOMMENDATIONS:

In May 2015, the Underground Storage Tank Cleanup Fund (USTCF) sent a letter to Mr. Lee documenting the results of a review of the site in April 2015. Based on the review, the USTCF found that the site fails the State Water Resource Control Board's (SWRCB) Low-Threat Closure Policy (LTCP) criterion due to the presence of free product in groundwater monitoring well MW-15 and the extent of the plume not being defined (or stable). The USTCF recommended performing free product removal on well MW-15, focused remediation on offsite wells MW-10 and MW-12, defining the extent of the contaminate plume, and evaluating additional source removal options for the former tank pit area.

Although free product has not been detected in well MW-15 for three consecutive quarters, significant concentrations of GRO continue to be reported. Based on Stratus's *Site Investigation Report* dated December 15, 2014, soil samples collected during the installation of well MW-15 indicated petroleum hydrocarbon impact to be highest between 20 and 25 feet below grade surface, beyond the depth of

excavation activities performed in 2012 at the site. In Stratus's *Technical Memo/Work Plan* dated March 5, 2014, it was recommended that if groundwater conditions warranted, in situ chemical oxidation (ISCO) would be implemented within the source area. Although concentrations of petroleum hydrocarbons continue to decline in well MW-15, ISCO appears appropriate at this time; therefore, in accordance with the USTCF's recommendation, Stratus recommends implementing the *Technical Memo/Work Plan* and installing three injection wells within the source area.

In addition, Stratus recommends preparing a work plan to determine the extent of the petroleum hydrocarbon plume down gradient of the site.

#### LIMITATIONS:

This document was prepared in general accordance with accepted standards of care that existed at the time this work was performed. No other warranty, expressed or implied, is made. Conclusions and recommendations are based on field observations and data obtained from this work and previous investigations. It should be recognized that definition and evaluation of geologic conditions is a difficult and somewhat inexact science. Judgments leading to conclusions and recommendations are generally made with an incomplete knowledge of the subsurface conditions present. More extensive studies may be performed to reduce uncertainties. This document is solely for the use and information of our client unless otherwise noted.

**TABLE 2**  
**GROUNDWATER ELEVATION AND ANALYTICAL SUMMARY**  
 German Autocraft, 301 E. 14th Street, San Leandro, California

Well Number	Date Collected	Depth to Free Product (feet)	Depth to Water (feet)	Free Product Thickness (feet)	Top of Casing (ft msl)	Groundwater Elevation (ft msl)	DRO (µg/L)	GRO[1] (µg/L)	Benzene (µg/L)	Toluene (µg/L)	Ethyl-benzene (µg/L)	Total Xylenes [3,4] (µg/L)	MTBE (µg/L)	TBA (µg/L)	DIPE (µg/L)	ETBE (µg/L)	TAME (µg/L)	1,2-DCA (µg/L)	EDB (µg/L)	Lead (Pb) (µg/L)
<b>Legend/Key:</b>																				
GRO = Gasoline Range Organics C4-C13																				
MTBE = Methyl tertiary butyl ether																				
TBA = Tertiary butyl alcohol																				
DIPE = Di-isopropyl ether																				
ETBE = Ethyl tertiary butyl ether																				
TAME = Tertiary amyl methyl ether																				
1,2-DCA = 1,2-Dichloroethane																				
EDB = 1,2-Dibromoethane																				
-- = not measured, not analyzed, or not available																				
ft msl = feet above mean sea level																				
µg/L = micrograms per liter																				
Analytical data present here prior to first quarter 2010 provided by Groundwater Cleaners, Inc. Stratus has not reviewed laboratory reports and makes no representations regarding accuracy of these data.																				
All site wells were surveyed on December 9, 2014, by Morrow Surveying (LS8501).																				
<b>Analytical Methods:</b>																				
GRO analyzed according to EPA Method 8015B																				
BTEX and MTBE analyzed according to EPA Method 8020/8021B prior to 2010																				
Beginning in 2010, BTEX, MTBE, TBA, DIPE, ETBE, and TAME analyzed by EPA Method 8260B																				
<b>Laboratory Qualifiers/Flags/Notes:</b>																				
[1] GRO reported as Total Petroleum Hydrocarbons as Gasoline (TPHg) prior to 2010.																				
[2] This value may be inaccurate. <i>Second Quarter 1996 Environmental Activities Report</i> , dated August 8, 1996 by Environmental Testing & Management casts doubt on the validity of this laboratory result.																				
[3] When two MTBE results listed, the first is by EPA 8020/8021 and second is confirmation by 8260. If only one result, by 8260.																				
[4] All MTBE results by EPA 8020, except where qualified by [3] and during 3/15/10 event when analyzed by 8260.																				
[5] Reporting limits were increased due to high concentrations of target analytes.																				
[6] DRO concentration may include contributions from lighter-end hydrocarbons that elute in the DRO range.

## **APPENDIX B**

### **SAMPLING AND ANALYSES PROCEDURES**

## APPENDIX B

### **SAMPLING AND ANALYSIS PROCEDURES**

---

The sampling and analysis procedures as well as the quality assurance plan are contained in this appendix. The procedures and adherence to the quality assurance plan will provide for consistent and reproducible sampling methods; proper application of analytical methods; accurate and precise analytical results; and finally, these procedures will provide guidelines so that the overall objectives of the monitoring program are achieved.

#### **Ground Water and Liquid-Phase Petroleum Hydrocarbon Depth Assessment**

A water/hydrocarbon interface probe is used to assess the liquid-phase petroleum hydrocarbon (LPH) thickness, if present, and a water level indicator is used to measure the ground water depth in monitoring wells that do not contain LPH. Depth to ground water or LPH is measured from a datum point at the top of each monitoring well casing. The datum point is typical a notch cut in the north side of the casing edge. If a water level indicator is used, the tip is subjectively analyzed for hydrocarbon sheen.

#### **Subjective Analysis of Ground Water**

Prior to purging, a water sample is collected from the monitoring well for subjective assessment. The sample is retrieved by gently lowering a clean, disposable bailer to approximately one-half the bailer length past the air/liquid interface. The bailer is then retrieved, and the sample contained within the bailer is examined for floating LPH and the appearance of a LPH sheen.

#### **Monitoring Well Purging and Sampling**

Monitoring wells are purged using a pump or bailer until pH, temperature, and conductivity of the purge water has stabilized and a minimum of three well volumes of water have been removed. If three well volumes can not be removed in one half hour's time the well is allowed to recharge to 80% of original level. After recharging, a ground water sample is then removed from each of the wells using a disposable bailer.

A Teflon bailer, electric submersible or bladder pump will be the only equipment used for well sampling. When samples for volatile organic analysis are being collected, the pump flow will be regulated at approximately 100 milliliters per minute to minimize pump effluent turbulence and aeration. Glass bottles of at least 40-milliliters volume and fitted with Teflon-lined septa will be used in sampling for volatile organics. These bottles will be filled completely to prevent air from remaining in the bottle. A positive meniscus forms when the bottle is completely full. A convex Teflon septum will be placed over the positive meniscus to eliminate air. After the bottle is capped, it is inverted and tapped to verify that it contains no air bubbles. The sample containers for other parameters will be filled, filtered as required, and capped.

The water sample is collected, labeled, and handled according to the Quality Assurance Plan. Water generated during the monitoring event is disposed of accruing to regulatory accepted method pertaining to the site.

## **QUALITY ASSURANCE PLAN**

Procedures to provide data quality should be established and documented so that conditions adverse to quality, such as deficiencies, deviations, nonconformities, defective material, services, and/or equipment, can be promptly identified and corrected.

### **General Sample Collection and Handling Procedures**

Proper collection and handling are essential to ensure the quality of a sample. Each sample is collected in a suitable container, preserved correctly for the intended analysis, and stored prior to analysis for no longer than the maximum allowable holding time. Details on the procedures for collection and handling of samples used on this project can be found in this section.

### **Soil and Water Sample Labeling and Preservation**

Label information includes a unique sample identification number, job identification number, date, and time. After labeling all soil and water samples are placed in a Ziploc® type bag and placed in an ice chest cooled to approximately 4° Celsius. Upon arriving at Stratus' office the samples are transferred to a locked refrigerator cooled to approximately 4° Celsius. Chemical preservation is controlled by the required analysis and is noted on the chain-of-custody form. Trip blanks supplied by the laboratory accompany the groundwater sample containers and groundwater samples.

Upon recovery, the sample container is sealed to minimize the potential of volatilization and cross-contamination prior to chemical analysis. Soil sampling tubes are typically closed at each end with Teflon® sheeting and plastic caps. The sample is then placed in a Ziploc® type bag and sealed. The sample is labeled and refrigerated at approximately 4° Celsius for delivery, under strict chain-of-custody, to the analytical laboratory.

### **Sample Identification and Chain-of-Custody Procedures**

Sample identification and chain-of-custody procedures document sample possession from the time of collection to ultimate disposal. Each sample container submitted for analysis has a label affixed to identify the job number, sampler, date and time of sample collection, and a sample number unique to that sample. This information, in addition to a description of the sample, field measurements made, sampling methodology, names of on-site personnel, and any other pertinent field observations, is recorded on the borehole log or in the field records. The samples are analyzed by a California-certified laboratory.

A chain-of-custody form is used to record possession of the sample from time of collection to its arrival at the laboratory. When the samples are shipped, the person in custody of them relinquishes the samples by signing the chain-of-custody form and

noting the time. The sample-control officer at the laboratory verifies sample integrity and confirms that the samples are collected in the proper containers, preserved correctly, and contain adequate volumes for analysis. These conditions are noted on a Laboratory Sample Receipt Checklist that becomes part of the laboratory report upon request.

If these conditions are met, each sample is assigned a unique log number for identification throughout analysis and reporting. The log number is recorded on the chain-of-custody form and in the legally-required log book maintained by the laboratory. The sample description, date received, client's name, and other relevant information is also recorded.

### **Equipment Cleaning**

Sample bottles, caps, and septa used in sampling for volatile and semivolatile organics will be triple rinsed with high-purity deionized water. After being rinsed, sample bottles will be dried overnight at a temperature of 200°C. Sample caps and septa will be dried overnight at a temperature of 60°C. Sample bottles, caps, and septa will be protected from solvent contact between drying and actual use at the sampling site. Sampling containers will be used only once and discarded after analysis is complete.

Plastic bottles and caps used in sampling for metals will be soaked overnight in a 1-percent nitric acid solution. Next, the bottles and caps will be triple rinsed with deionized water. Finally, the bottles and caps will be air dried before being used at the site. Plastic bottles and caps will be constructed of linear polyethylene or polypropylene. Sampling containers will be used only once and discarded after analysis is complete. Glass and plastic bottles used by Stratus to collect groundwater samples are supplied by the laboratory.

Before the sampling event is started, equipment that will be placed in the well or will come in contact with groundwater will be disassembled and cleaned thoroughly with detergent water, and then steam cleaned with deionized water. Any parts that may absorb contaminants, such as plastic pump valves, etc. will be cleaned as described above or replaced.

During field sampling, equipment surfaces that are placed in the well or contact groundwater will be steam cleaned with deionized water before the next well is purged or sampled. Equipment blanks will be collected and analyzed from non-disposable sampling equipment that is used for collecting groundwater samples at the rate of one blank per twenty samples collected.

### **Internal Quality Assurance Checks**

Internal quality assurance procedures are designed to provide reliability of monitoring and measurement of data. Both field and laboratory quality assurance checks are necessary to evaluate the reliability of sampling and analysis results. Internal quality assurance procedures generally include:

- Laboratory Quality Assurance

- Documentation of instrument performance checks
- Documentation of instrument calibration
- Documentation of the traceability of instrument standards, samples, and data
- Documentation of analytical and QC methodology (QC methodology includes use of spiked samples, duplicate samples, split samples, use of reference blanks, and check standards to check method accuracy and precision)

- Field Quality Assurance

- Documentation of sample preservation and transportation
- Documentation of field instrument calibration and irregularities in performance

Internal laboratory quality assurance checks will be the responsibility of the contract laboratories. Data and reports submitted by field personnel and the contract laboratory will be reviewed and maintained in the project files.

**Types of Quality Control Checks**

Samples are analyzed using analytical methods outlined in EPA Manual SW 846 and approved by the California Regional Water Quality Control Board-Central Valley Region in the Leaking Underground Fuel Tanks (LUFT) manual and appendices. Standard contract laboratory quality control may include analysis or use of the following:

- Method blanks – reagent water used to prepare calibration standards, spike solutions, etc. is analyzed in the same manner as the sample to demonstrate that analytical interferences are under control.
- Matrix spiked samples – a known amount of spike solution containing selected constituents is added to the sample at concentrations at which the accuracy of the analytical method is to satisfactorily monitor and evaluate laboratory data quality.
- Split samples – a sample is split into two separate aliquots before analysis to assess the reproducibility of the analysis.
- Surrogate samples – samples are spiked with surrogate constituents at known concentrations to monitor both the performance of the analytical system and the effectiveness of the method in dealing with the sample matrix.
- Control charts – graphical presentation of spike or split sample results used to track the accuracy or precision of the analysis.
- Quality control check samples – when spiked sample analysis indicates atypical instrument performance, a quality check sample, which is prepared independently of the calibration standards and contains the constituents of interest, is analyzed to confirm that measurements were performed accurately.

- Calibration standards and devices – traceable standards or devices to set instrument response so that sample analysis results represent the absolute concentration of the constituent.

Field QA samples will be collected to assess sample handling procedures and conditions. Standard field quality control may include the use of the following, and will be collected and analyzed as outlined in EPA Manual SW 846.

- Field blanks – reagent water samples are prepared at the sampling location by the same procedure used to collect field groundwater samples and analyzed with the groundwater samples to assess the impact of sampling techniques on data quality. Typically, one field blank per twenty groundwater samples collected will be analyzed per sampling event.
- Field replicates – duplicate or triplicate samples are collected and analyzed to assess the reproducibility of the analytical data. One replicate groundwater sample per twenty samples collected will be analyzed per sampling event, unless otherwise specified. Triplicate samples will be collected only when specific conditions warrant and generally are sent to an alternate laboratory to confirm the accuracy of the routinely used laboratory.
- Trip blanks – reagent water samples are prepared before field work, transported and stored with the samples and analyzed to assess the impact of sample transport and storage for data quality. In the event that any analyte is detected in the field blank, a trip blank will be included in the subsequent groundwater sampling event.

Data reliability will be evaluated by the certified laboratory and reported on a cover sheet attached to the laboratory data report. Analytical data resulting from the testing of field or trip blanks will be included in the laboratory's report. Results from matrix spike, surrogate, and method blank testing will be reported, along with a statement of whether the samples were analyzed within the appropriate holding time.

Stratus will evaluate the laboratory's report on data reliability and note significant QC results that may make the data biased or unacceptable. Data viability will be performed as outlined in EPA Manual SW 846. If biased or unacceptable data is noted, corrective actions (including re-sample/re-analyze, etc.) will be evaluated on a site-specific basis.

### Comments:

Calculations are based off of raw (non-rounded) data. However, for reporting purposes, all QC data is rounded to three significant figures. Therefore, hand calculated values may differ slightly.

Reported in micrograms per Liter, per client request.
