Dublin, California
ACHCSA Case No. 304

Dear Mr. Chan:

I, Mr. Hooshang Hadjian, have retained Pangea Environmental Services, Inc. (Pangea) as the environmental consultant for the project referenced above. Pangea is submitting the attached report on my behalf.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached report is true and correct to the best of my knowledge.

Sincerely,

Hooshang Hadjian

ACHCSA Case No. 304

Dear Mr. Chan:

On behalf of Mr. Hooshang Hadjian, Pangea Environmental Services, Inc. has prepared this *Groundwater Monitoring Report – Second Quarter 2007*. The report describes groundwater monitoring, sampling, and other site activities.

Sincerely,
Pangea Environmental Services, Inc.

Bob Clark-Riddell, P.E.
Principal Engineer

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

INTRODUCTION

On behalf of Mr. Hooshang Hadjian, Pangea Environmental Services, Inc. (Pangea) conducted groundwater monitoring and sampling activities during this quarter at the subject site (Figure 1). The purpose of the monitoring and sampling is to evaluate groundwater flow direction and dissolved contaminant concentrations, and to inspect site wells for separate-phase hydrocarbons (SPH). Current groundwater analytical results and elevation data are shown on Figure 2. Current and historical data are summarized on Table 1.

SITE BACKGROUND

The Dublin Auto Wash retail gasoline station is located at the southwest corner of Dublin Boulevard and Village Parkway in Dublin, California (Figure 1). Currently, there are three 10,000-gallon underground storage tanks (USTs) and a carwash at the site. Land use immediately surrounding the station is commercial with residential land use further from the site.

From approximately 1988 to 1997, Chevron Products Company performed assessment and remediation of the site. A soil vapor extraction (SVE) system was operated at the site from December 1992 through June 1995. Mr. Hadjian is the responsible party for an unauthorized release from a leaking stainless steel flex-hose near the northernmost dispenser island in February 1997. Subsequently, a new product delivery system was installed and about 31 cubic yards of contaminated soil was removed from the release area. Gettler-Ryan, Inc. monitored the eight existing groundwater wells at the site until 2003, when SOMA Environmental Engineering, Inc., took over groundwater monitoring at the site and conducted further characterization of the site using electrical conductivity logging to identify potential water-bearing zones. In November 2004, Pangea commenced coordination of groundwater monitoring and corrective action for the site. To delineate the contamination detected during SOMA's investigation, Pangea in 2006 installed additional monitoring wells with shorter screen lengths in identified water-bearing zones.

The site subsurface consists primarily of clay, sandy clay, and clayey sand. The shallower soil (<34 ft bgs) is predominantly clay and sandy clay with thin seams of clayey sand, while the deeper soil (>34 ft bgs) contains clayey sand units of apparently higher permeability than shallower materials. In March, April and May, 2006, Pangea installed fourteen monitoring wells to help define the vertical and lateral extent of groundwater contamination in the identified water-bearing zones. Wells with shorter screen lengths than existing wells were installed in the upper shallow (AA) zone from approximately 9 to 14 ft bgs (MW-7AA), the shallow (A) zone from approximately 15 to 20 ft bgs (MW-3A, MW-6A, MW-7A, MW-8A, MW-9A and MW-10A), the middle (B) zone from approximately 25 to 30 ft bgs (MW-6B and MW-7B), and the deep (C) zone from approximately 34 to 45 ft bgs (MW-6C, MW-7C, MW-9C, MW-10C and MW-11C). The well screen in MW-3A was installed at a shallower depth than the other A-zone wells to intercept the SPH previously observed in abandoned well MW-3.

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

The shallower (AA, A and B) water-bearing zones primarily consist of thin seams of clayey sand within sandy clay, while higher permeability silty sand and clayey sand are the predominant soil types constituting the deeper (C) water-bearing zone. Vapor wells VW-1 through VW-3 are screened from approximately 3 to 9 ft bgs above the upper shallow seasonal water-bearing zone, which appears to be a perched zone. In late March and early April 2006, wells EA-1, EA-2, EA-3 and MW-3 were abandoned to reduce the risk of vertical contaminant migration and improve the quality of contaminant concentration and groundwater elevation data. To compare the elevation of surface water in the flood control channel with site groundwater, point C-1 was surveyed on the roadway overpass above the channel. Well construction details are presented in Table 2.

An interim remedial action was conducted by Pangea on July 7, 2006 by extracting approximately 40 gallons of impacted liquid from wells MW-3A and MW-7AA with a vacuum truck.

GROUNDWATER MONITORING AND SAMPLING

On May 15, 2007, groundwater monitoring and sampling was conducted at the site. All well caps were removed the night before monitoring was conducted to allow water levels to stabilize. Groundwater samples were obtained from groundwater monitoring wells (MW-1, MW-2, MW-3A, MW-4, MW-5, MW-6A, MW-6B, MW-7AA, MW-7A, MW-7B, MW-8A, MW-9A and MW-10A) and from the three vapor wells (VW-1, VW-2 and VW-3). Sampling of the three vapor wells was initially requested in a February 9, 2006 letter from Alameda County Environmental Health (ACEH). The depth to water at survey point C-1 above the flood control channel was also measured. Deep monitoring wells MW-6C, MW-7C, MW-9C, MW-10C and MW-11C were not gauged or sampled due to the lack of any significant historical detection in these wells over more than a year of monitoring.

Before well purging, the dissolved oxygen (DO) concentration was measured in each well. DO was measured by lowering a downwell sensor to the approximate middle of the water column, and allowing the reading to stabilize during gentle height adjustment. Prior to sample collection, approximately three casing volumes of water were purged using disposable bailers, an electric submersible pump, positive air displacement pump, or a peristaltic pump. During well purging, field technicians measured the pH, temperature and conductivity. Groundwater samples were collected from each well with a disposable bailer, and decanted into the appropriate containers supplied by the analytical laboratory. Groundwater samples were labeled, placed in protective plastic bags, and stored on crushed ice at or below 4°C. All samples were transported under chain-of-custody to a State-certified analytical laboratory. Purge water was temporarily stored onsite in DOT-approved 55-gallon drums. Groundwater monitoring field data sheets are presented in Appendix A.

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

MONITORING RESULTS

Current and historical groundwater elevation data and analytical results are described below and summarized on Table 1. Groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by modified EPA Method 8015C; and benzene, toluene, ethylbenzene, xylenes (BTEX), and methyl tertiary butyl ether (MTBE) by EPA Method 8021B. Samples were analyzed by McCampbell Analytical, Inc. of Pittsburg, California, a State-certified laboratory. The laboratory analytical report is included in Appendix B. DO concentrations ranged from 0.10 mg/L (well VW-1) to 0.52 mg/L (well MW-6A).

Groundwater Flow Direction

Groundwater elevations in shallow and intermediate zones, based on depth-to-water data collected May 15, 2007, are shown on Figure 2 and discussed below. Groundwater flow at the site is complex due to the combined effects of a generally upward gradient, the nearby creek/flood control channel, seasonal fluctuations in flow direction, and possible influences of the city sewer line located beneath Dublin Boulevard. To ensure that measured groundwater depths were representative of equilibrated piezometric elevations, all well caps were removed the day before well gauging.

Vertical Gradient Evaluation: A comparison of clustered well pairs screened at different depths indicates that a consistent upward gradient component of approximately 0.15 ft/ft is present between the shallow and intermediate water-bearing zones at the portion of the site north of the dispenser islands. In clustered wells southwest of the dispenser islands, a significantly smaller upward gradient is present, as shown on Table A. In addition, it should be noted that a downward gradient appears to be present between the shallow vapor wells

Table A – Vertical Gradient Evaluation using Paired Monitoring Wells

Monitoring Well Pair	Groundwater Elevation	Mean Screen Depth	Calculated Vertical Gradient
MW-6A	320.12	17.5	
MW-6B	321.69	28	
<i>Difference</i>	<i>1.57</i>	<i>10.5</i>	<i>0.150 (upwards)</i>
MW-7A	320.56	18	
MW-7B	320.72	28	
<i>Difference</i>	<i>0.16</i>	<i>10</i>	<i>0.0160 (upwards)</i>

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

(VW-1, VW-2 and VW-3) and the shallow monitoring wells, although this is likely a result of perched groundwater in the vicinity of the UST excavation.

Horizontal Gradient Evaluation: Depth-to-water measurements collected during prior monitoring events indicate that the horizontal component of the groundwater flow direction for the *shallow* wells has been fairly inconsistent, and has not yielded a noticeable pattern since new wells were installed in 2006. As shown on Figure 2, the horizontal component of the groundwater flow direction in the *shallow* wells at the site for the current monitoring event appears to converge along Dublin Boulevard and is possibly influenced by the more permeable backfill around the sanitary sewer line beneath Dublin Boulevard. The horizontal component of groundwater flow in the *intermediate depth* wells could not be determined since only two wells are screened at that depth.

Conclusion: The primary observation regarding the piezometric surface is that a moderately well-defined upward gradient is present in wells north of the dispenser islands. Future monitoring and analysis will help define the consistency and magnitude of this upward gradient. Historical depth-to-water and groundwater elevation data for the site are presented in Table 1.

Hydrocarbon Distribution in Groundwater

No separate-phase hydrocarbons (SPH) were detected in site wells this quarter. SPH has not been detected in well MW-3A, since May 2006, shortly after well installation. The brief interim remedial action conducted on July 7, 2006, which consisted of removal of approximately 40 gallons of impacted liquid from well MW-3A using a vacuum truck, could have improved site conditions near well MW-3A.

Petroleum hydrocarbons were detected in monitoring wells MW-3A, MW-6A, MW-7AA, and MW-9A and in vapor wells VW-1, VW-2 and VW-3, as shown on Table 1 and Figure 2. Well MW-7AA, located adjacent to the former release point, had the highest TPHg (11,000 µg/L) and benzene (1,500 µg/L) concentrations of all site groundwater wells. Petroleum hydrocarbon concentrations detected this quarter were within historic limits in all wells except VW-1, which contained historic high concentrations of TPHg (2,000 µg/L) and benzene (270 µg/L).

In general, hydrocarbon contamination is concentrated in the upper shallow (AA) and shallow (A) water-bearing zones. No petroleum hydrocarbons were detected above reporting limits in either of the two sampled intermediate (B) depth wells.

Fuel Oxygenate Distribution in Groundwater

MTBE was detected above reporting limits in wells MW-1, MW-2, MW-3A, MW-6A, MW-7AA, MW-7A, MW-8A, MW-9A, VW-1, and VW-2 as shown on Table 1 and Figure 2. The highest MTBE concentration was in source-area well MW-7AA (47,000 µg/L), which represents a historic high for this well. MTBE

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

concentrations detected in wells MW-6A (7,300 µg/L) and VW-1 (720 µg/L) also represent historic highs for each well, while MTBE concentrations detected in monitoring wells MW-3A (3,500 µg/L), MW-7A (45 µg/L), and MW-8A (13 µg/L) represent historic lows for each well. MTBE concentrations in other sampled wells were within historic limits.

MTBE concentrations in well MW-3A are substantially lower than the concentrations measured previously in this well and in adjacent abandoned well MW-3. Also, MTBE concentrations in well MW-1 had been steadily increasing over the past three years and reached a historic high of 8,400 µg/L during the fourth quarter 2006 monitoring event, but decreased again from 3,600 µg/L during the first quarter 2007 to 2,500 µg/L this quarter. The concentration reductions in well MW-1 may be a result of the interim remediation performed in July 2006.

OTHER SITE ACTIVITIES

Upcoming Monitoring and Proposed Frequency

Pangea will continue quarterly groundwater monitoring and sampling at the site. Pangea will sample all shallow onsite groundwater monitoring wells quarterly. Upgradient offsite wells MW-4 and MW-5 will be sampled annually during the first quarter of each year. All monitored wells will be gauged for depth to water and inspected for SPH. All groundwater samples will be analyzed for TPHg/BTEX/MTBE by EPA Method 8015Cm/8021B. Pangea has discontinued sampling of all deep groundwater monitoring wells (MW-6C, MW-7C, MW-9C, MW-10C and MW-11C).

The upcoming monitoring will also include the following activities:

- To evaluate shallow conditions at the site, Pangea will continue to gauge vapor wells VW-1 through VW-3 and to sample these wells if they contain sufficient water.
- To compare surface water and groundwater elevation and help evaluate whether groundwater is impacting the flood control channel, Pangea will measure the depth to water at survey point C-1 at the overpass of the flood control channel.
- To address apparently non-representative water levels measured in some site wells due to slow recovery, Pangea will open well caps the day prior to monitoring for future monitoring events.

Pangea will summarize groundwater monitoring activities and results in a groundwater monitoring report.

Groundwater Monitoring Report – Second Quarter 2007
7240 Dublin Boulevard
Dublin, California
September 10, 2007

Additional Assessment and Remediation

On August 11, 2006, Pangea submitted a *Site Investigation Report* documenting recent site assessment, well installation, and interim remediation activities. In the report, Pangea recommended the installation of additional shallow monitoring wells and implementation of short-term remediation activities. Pangea is awaiting regulatory response prior to implementing these recommendations.

Electronic Reporting

The report, laboratory data, and other applicable information will be uploaded to the State Water Resource Control Board's Geotracker database.

ABBREVIATIONS AND NOTES:

SPH = Separate-phase hydrocarbons; calculated groundwater elevation corrected for SPH by the relation: Groundwater Elevation = Well Elevation - Depth to Water +(0.8xSPH Thickness)
 Groundwater monitoring data and laboratory analytical results prior to December 14, 2004, were scanned from a report by SOMA.
 (ft) = Feet
 (msl) = Mean sea level
TOC Elev. (ft) = Top of casing elevation
 µg/L = micrograms per liter - approximately equal to parts per billion = ppb
 mg/L = milligrams per liter - approximately equal to parts per million = ppm
 TPHg = Total petroleum hydrocarbons as gasoline by modified EPA Method 8015C
 BTEX by EPA Method 8020/8021.
 MTBE = Methyl tertiary butyl ether by EPA Method 8020/8021. (Concentrations in parentheses are by EPA Method 8260B).
 1,2-DCA = 1,2-Dichloroethane
 TAME = Tertiary amyl methyl ether by EPA Method 8260B
 TBA = Tertiary butyl alcohol by EPA Method 8260B
 DiPE = Diisopropyl ether by EPA Method 8260B
 ETBE = Ethyl tertiary butyl ether by EPA Method 8260B
 -- = Not Measured/Not Analyzed
 1 Laboratory report indicates weathered gasoline C6-C12.
 Dissolved oxygen concentrations measured downhole pre-purge or pre-purge/post-purge.
 * = cap loose, sprinkler runoff entering well.

	Client P.O.:	Date Completed: 05/23/07

WorkOrder: 0705457

May 23, 2007

Dear Bob:

Enclosed are:

- 1). the results of **14** analyzed samples from your **#1001.001; Dublin Car Wash project**,
- 2). a QC report for the above samples
- 3). a copy of the chain of custody, and
- 4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Best regards,

Angela Rydelius, Lab Manager

013A	VW-2	W	430,a	470	40	1.5	ND	1.0	1	110
014A	VW-3	W	5600,a	ND<90	270	6.9	110	110	10	98

Reporting Limit for DF =1; ND means not detected at or above the reporting limit	W	50	5.0	0.5	0.5	0.5	0.5	1	μg/L
	S	NA	NA	NA	NA	NA	NA	1	mg/Kg

* water and vapor samples and all TCLP & SPLP extracts are reported in ug/L, soil/sludge/solid samples in mg/kg, wipe samples in μg/wipe, product/oil/non-aqueous liquid samples in mg/L.

cluttered chromatogram; sample peak coelutes with surrogate peak.

+The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation: a) unmodified or weakly modified gasoline is significant; b) heavier gasoline range compounds are significant(aged gasoline?); c) lighter gasoline range compounds (the most mobile fraction) are significant; d) gasoline range compounds having broad chromatographic peaks are significant; biologically altered gasoline?; e) TPH pattern that does not appear to be derived from gasoline (stoddard solvent / mineral spirit?); f) one to a few isolated non-target peaks present; g) strongly aged gasoline or diesel range compounds are significant; h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) reporting limit raised due to high MTBE content; k) TPH pattern that does not appear to be derived from gasoline (aviation gas). m) no recognizable pattern; n) TPH(g) range non-target isolated peaks subtracted out of the TPH(g) concentration at the client's request; p) see attached narrative.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

^f TPH(btex) = sum of BTEX areas from the FID.

cluttered chromatogram; sample peak coelutes with surrogate peak.
