Subject: Phase II Subsurface Investigation
1450 Fruitvale Avenue
Oakland, California
Project No. 3397

Dear Mr. Jay and Mr. Phares:

The following letter report describes the activities and results of the subsurface investigation performed by AEI Consultants at the above referenced property (Figure 1: Site Location Map). The investigation included the collection of soil and groundwater samples from four soil borings on the property. The project was designed to further assess the extent and magnitude of impacted soil and groundwater beneath the site.

I Background

The property is located on the eastern corner of Fruitvale Avenue and Farnam Street in a residential and commercial area of the city of Oakland. The property is approximately 11,000 square feet in size and is developed with a three-story building that occupies two-thirds of the parcel. The western corner of the parcel is improved with an asphalt parking lot. The building is currently occupied by a tire service business.

Glenfos, Inc performed an environmental site assessment (ESA) on the property in July 1998. The ESA indicated that the property was developed as a gas station in 1950 by Richfield Oil (currently known as ARCO) and operated until at least 1983. There were four underground storage tanks located in the southwest corner of the current parking lot. The fuel dispenser island was located on the northeast corner of the current parking lot. The gas station was demolished and the existing warehouse was constructed after 1983.

This ESA included the advancement of eight (8) shallow soil borings to between 15 and 30 feet below ground surface (bgs) and the collection of soil and groundwater samples (refer to Figure 2 for boring locations). Soil sample analysis indicated that Total Petroleum Hydrocarbons (TPH) as gasoline and benzene were present along the former product piping at 190 mg/kg and 0.34 mg/kg, respectively. Groundwater sample analysis revealed impacted groundwater beneath the

area of the former dispensers with TPH as gasoline up to 20,000 µg/L and benzene up to 1,000 µg/L. A geophysical survey was also performed on the property as part of the ESA, and based on the results of the survey, Glenfos concluded that, "the USTs may still be present".

On May 27, 1999, AEI was contracted to excavate the locations of the suspected USTs and remove them if necessary. Three excavations were opened on the site in the locations shown in Figure 2. No underground storage tanks or any remaining product piping were encountered during the excavation activities. No significant concentrations of petroleum hydrocarbons were detected in the confirmation soil samples analyzed. The excavations were backfilled with the excavated soil.

Please refer to the *Subsurface Investigation* report issued by AEI on June 11, 1999 for the results of the excavation and sampling activities as well as an appended copy of the *Glenfos* report.

On July 21, 1999, AEI reviewed building records at the Oakland Building Department (OBD) for information regarding the former locations of the USTs and product dispensers. According to a site plan of the former gasoline station, four USTs were located on the southern corner of the lot, just outside of the building, oriented perpendicular to Farnam Street. The dispensers were located on the northern corner of the property, beneath the canopy.

At the request of the Alameda County Health Care Services Agency (ACHCSA), AEI prepared a workplan to further define the extent of impacted soil and groundwater found during the Glenfos investigation. This workplan was approved by Mr. Barney Chan of the ACHCSA in a letter dated July 28, 1999.

II Investigative Efforts

AEI performed a subsurface investigation at the property on August 23, 1999. A total of four soil borings (AEI-9 through AEI-12) were advanced. The boring locations were chosen to further assess the extent of impacted soil around the former product piping and dispenser locations and the extent of dissolved petroleum hydrocarbons in the groundwater beneath the site. The locations of the soil borings are shown on Figure 2.

The near surface native soil encountered during the boring advancement consisted of silty and sandy clay. Gravel was present locally up to 3 cm. Refer to Attachment A for detailed logs of the borings. The local topography of the area is generally flat sloping very gently to the southwest, therefore groundwater is expected to flow to the southwest.

Soil Sample Collection

The borings were advanced with a direct push Geoprobe drilling rig to a depth of approximately 34 feet bgs. Soil samples were collected at approximately five foot intervals beginning at five feet bgs.

A moderate to strong hydrocarbon odor was observed during the advancement of the soil borings. The soil samples were screened in the field using a Photo-ionizing Detector (PID). The soil screening data and field observations are presented on the borings logs (Attachment A). Soil samples were collected in 2-foot long acrylic liners, from which a six inch sample was chosen. The soil samples were sealed with teflon tape and plastic caps and placed in a cooler with wet ice to await transportation to the laboratory.

Groundwater Sample Collection

Groundwater was encountered at 32 feet bgs and quickly generated up to 14 feet bgs during the advancement of soil boring AEI-9. Groundwater was not encountered in any of the other three borings. Slotted PVC pipe was inserted into two of the other borings, AEI-11 and AEI-12, which remained open until the following day, to allow for groundwater generation. However no collectable groundwater had generated 24 hours after drilling. Based on the geologic and hydrologic conditions encountered during this and the previous investigation, confined groundwater conditions may exist beneath the site.

A groundwater sample was collected from AEI-9 into 40-mL VOA vials using a drop tube inserted through the direct push rods. The groundwater samples were capped so that there was no head space or visible air bubbles within the vials, then placed in a cooler with wet ice to await transportation to the laboratory.

Following sample collection, and the removal of the PVC pipe from AEI-11 and AEI-12, each boring was backfilled with cement/bentonite grout.

Laboratory Analysis

On August 23, 1999, the soil and groundwater samples were transported to McCampbell Analytical Inc. (DOHS Certification Number 1644) under chain of custody protocol for analysis. Analytical results and chain of custody documents are included as Attachment B.

Two soil samples from each boring were selected for analysis. The soil and groundwater samples were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030/8015, benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA method 5030/8020. The groundwater sample was also analyzed by EPA method 8260 to confirm the presence or absence of MTBE in this sample.

Any remaining soil samples were placed on hold at the laboratory.

III Findings

TPH as gasoline was detected up to 21 mg/kg in a soil sample collected from AEI-11 at 15' bgs. No significant concentrations of BTEX or MTBE were detected in the soil samples analyzed during this investigation.

TPH as gasoline was detected at 690 µg/L in the groundwater sample collected from AEI-9. Benzene and MTBE were detected in this sample at 72 µg/L and 3.8 µg/L, respectively.

Soil and groundwater sample analysis obtained during this investigation and the previous investigation performed by Glenfos are summarized in Tables 1 & 2.

IV Conclusions and Recommendations

Moderate concentrations of TPH as gasoline have been detected in soil samples collected from near the former product piping and in the vicinity of the former dispenser island. TPH as gasoline and benzene have been detected in the groundwater beneath the site in significant concentrations.

Although the concentrations of TPH as gasoline detected in the soil may not be considered very significant, the extent of TPH as gasoline and benzene in the groundwater has not been fully defined. The groundwater flow direction at this site has been assumed to be to the southwest, however, true groundwater flow direction is unknown. Further investigation may be required by the ACHCSA to determine true groundwater flow direction at the site and the downgradient extent of impacted groundwater.

V Report Limitation

This report presents a summary of work completed by AEI Consultants. The completed work includes observations and descriptions of site conditions encountered. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide the required information, but it cannot be assumed that they are representative of areas not sampled. All conclusions and/or recommendations are based on these analyses and observations, and the governing regulations. Conclusions beyond those stated and reported herein should not be inferred from this document.

These services were performed in accordance with generally accepted practices, in the environmental engineering and construction field, which existed at the time and location of the work.

Dear Peter:

Enclosed are:

- 1). the results of 1 samples from your **Fruitvale** project,
- 2). a QC report for the above samples
- 3). a copy of the chain of custody, and
- 4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Edward Hamilton, Lab Director

EXECUTIVE SUMMARY

At the request of Glendale Federal Bank., Glenfos has completed a Limited Phase I and Phase II environmental assessment of the site. The scope of our Limited Phase I Environmental Assessment was to review two previous environmental site assessments, review available building permits and drawings from the Oakland Building Department, review available records from the Oakland Fire Department, and conduct a geophysical survey. The scope of the Phase II assessment was to evaluate the potential for gasoline impacted soil and groundwater that may resulted from past use of the site as a gasoline station. The assessment included the collection of soil and groundwater samples in eight locations.

The review of the previous environmental reports indicated that the site was formerly occupied by a Richfield Oil gasoline station from 1950 to at least 1976. Glenfos research of the site indicated that this gasoline station may have been present on the site to at least 1983, based on a review of historical aerial photographs. A 1950 site map of the former gasoline station was found at the Oakland Building Department. The site map depicted the location of four USTs in the area currently within the southwest corner of the site's parking lot, and a single fuel dispenser island within the northwest corner of the site's parking lot.

The geophysical survey found magnetic anomalies in the area of the suspected product lines and the USTs of the former gasoline station. Hence, the USTs may be still present in this area.

The findings of the subsurface investigation revealed that the site's soil and groundwater have been impacted by gasoline. Up to 190 mg/kg of TPH-g, and 0.34 mg/kg of benzene, were found in some of the analyzed soil samples. The analysis of the groundwater samples indicated that TPH-g was detected in the groundwater at a concentration up to 20 mg/kg. Additionally, up to 1,000 ug/L of benzene was also found in the groundwater beneath the site. The highest concentration of gasoline hydrocarbons appear in the area of the former fuel dispenser and along the suspected product lines.

Based on the data, the site has been impacted by a release of gasoline. The source of the gasoline appears to be from the former on-site gasoline station, since shallow soil contamination was found beneath the site (at a depth of 10 feet below grade), and the lack of off-site sources identified in the previous and current assessments. Hence, Glenfos recommends additional subsurface exploration to further refine the vertical and lateral extent to the impacted soil and groundwater. Should this investigation confirm the presence of these USTs, they should be removed from the site in accordance with local regulations.

1.0 SCOPE

The purpose of the Limited Phase I Environmental Assessment was to supplement the previous environmental assessments performed by at the subject by others by conducting additional research. The purpose of the Phase II Environmental Assessment was to investigate the potential for subsurface petroleum contamination that may have resulted from the past use of the site as a gasoline station.

The scope of the Limited Phase I assessment originally consisted of the following tasks: researching records that may be available from ARCO (the former gas station operator) regarding plans of the former gasoline station; a review of building permits and plans at the Oakland Building Department; a review of files at the Oakland Fire Department, interview of knowledgeable persons, a review of aerial photographs, a geophysical survey, and an soil vapor survey.

Because a site plan of the former gas station was obtained from the Oakland Building Department it was not necessary to contact ARCO regarding their past gasoline station configuration. As the result of having obtained a good site map (Appendix B), showing the location of the former gas station's underground storage tanks (USTs) and fuel dispensers, and the findings of the geophysical survey, the client decided to forego the soil vapor survey and authorized a soil and groundwater assessment.

The scope of the Phase II assessment included Geoprobe soil/groundwater sampling at eight locations selected on the basis of the site map of the former gasoline station, and the data collected in the geophysical survey. Soil and groundwater samples were sampled and collected in these locations, and selected samples for analyzed for fuel related hydrocarbons, total lead, and MTBE.

The location of the site is shown on Figure 1, Site Location Map. The location of the Geoprobe sampling locations are shown on Figure 2, Facility Layout Map. Photographs documenting field activities are presented in Appendix A.

2.0 BACKGROUND

2.1 Site Description

The site's lot contains approximately 11,100 square feet, and is currently developed with a three story commercial/residential building which covers approximately two-thirds of the site. The building is currently used automotive tire service business. An inspection of the building revealed the presence of several tires and tire rims, automobiles, and other automotive supplies in the southern portion of the building, which is primarily used as a garage. Because of the large volume of tires, rims, and automobiles in this portion of the building, it could not be determined whether car hoists are present in the building. The northern portion of the building appears to have been used as a tavern and/or restaurant. Residential units appear to have been present on the floors above the garage and tavern/restaurant; access into the areas was not attempted due to the poor condition of the stairway, and the lack of lighting in the building.

The remainder of the site is paved with either asphalt or concrete. The condition of the asphalt and concrete was in general poor condition, with several large potholes and cracks present. The site is not landscaped.

2.2 Review of Previous Environmental Assessments

Glenfos was provided two previous environmental reports pertaining to the site for review. They included: "Limited Phase I Environmental Site Assessment Report, Commercial Property, 1450 Fruitvale Avenue, Oakland, California," prepared for CenFed Bank by Innovative Environmental Technologies, dated January 23, 1997; and "Verification of Underground Storage tanks at 1450 Fruitvale Avenue, Oakland, Alameda County, California," prepared for CenFed Bank by Envirotech Consultants, dated April 2, 1998.

The first report indicated that the site was occupied by De Leon Tires & Wheel Accessories, the current site occupant, during the site reconnaissance conducted on January 17, 1997. The historical research contained in this report indicated that the site was occupied by a Richfield Oil Company (now known as ARCO) gasoline station from 1950 to at least 1976. In 1976, the

property was bought by a Mr. Curtis Thomas, who demolished the gasoline station and constructed the existing warehouse/residential building. This report also indicated that the site was part of a larger parcel prior to development of the gas station, however, the area of the site appeared to have been mostly vacant, based on Sanborn Maps dated 1912 and 1925. The larger parcel was reportedly residential. No potential or known off-site sources of contamination were identified. The report recommended additional interviews be conducted with Mr. Thomas and/or contacting ARCO for information about the former gasoline station. The report also recommended that a Phase II subsurface assessment be conducted at the site if information is not available for the removal of the former gasoline station's USTs, and its associated product lines and dispensers.

The second investigation was conducted to verify the possible presence of USTs at the subject site. The verification procedures included: a physical inspection of the site; an electromagnetic survey of the site, eight soil borings to a depth of three to five inches; a review of available archival information consisting of certain agency lists and files; and consultation with parties in local and county agencies. Based on the research conducted in this investigation, there was no evidence found to indicate that the USTs were removed or the USTs were closed on the site. The electromagnetic survey identified a two-inch diameter steel pipe oriented north-south in the site's parking lot; this survey did not find evidence of buried USTs on the site. Additionally, the site drilling did not find evidence to suggest removal of the USTs. The conclusions in the report stated that "there is factual evidence of underground pipe and other suspected underground storage tank beneath the subject site."

3.0 ENVIRONMENTAL SETTING

3.1 Geographic Setting

The site is located within the Coast Ranges Geomorphic Province, approximately 1.5 miles north of the San Leandro Bay. The San Leandro Bay connects into the San Francisco Bay. The Coast Ranges Geomorphic Province consists of many elongate ranges and narrow valleys that approximately parallel the California coast, stretching approximately 600 miles, and are bounded by the Pacific Ocean to the west, the Great Central Valley of California to the east, the Transverse Ranges to the south, and the Klamath Mountains to the north. The local terrain is generally flat lying with a site elevation of approximately 40 feet above mean sea level based on information from the Oakland East, California topographic map, dated 1997 (Figure 1). The topographic gradient is shown on the map as directed toward the south towards the San Leandro Bay.

3.2 Geologic Conditions

According to the "Geologic Map of the San Francisco-San Jose Quadrangle, California," published in 1991, the near-surface soils in the site vicinity are composed of Quaternary alluvial deposits which consist of unconsolidated deposits of clay to gravel size sediments. These alluvial deposits are considered to be water bearing.

Based on the findings of the Phase II assessment conducted in this investigation, the natural surficial soils beneath the site consist primarily of clayey to sandy silts and silty clays in the upper 20 feet. A sandy gravel layer was encountered in some of the sampling locations at a depth of 20 to 25 feet. The fine grained soils found beneath the site are commonly referred to as "Bay Mud" deposits.

3.3 Groundwater Conditions

Groundwater was generally encountered at a depth of 20 feet beneath the site, within the sandy gravel layer. Groundwater appears to be confined beneath the site, because groundwater rose to 12 feet within five to ten minutes after completion of the geoprobe borehole. The groundwater gradient beneath the subject site is estimated to be towards the south, parallel to the topographic gradient.

3.4 Potential Pathways of Contaminant Migration

The groundwater gradient beneath the site is estimated to be towards the south. The depositional direction of the alluvial sediments appears to be toward the south. The potential contaminant sources most likely to affect the site are either upgradient, upslope, or opposite the depositional direction of sediments. For this site, these potential sources would generally be the ones adjacent to the north of the site.

4.0 LIMITED PHASE I ASSESSMENT

4.1 Oakland Building Department

The Oakland Building Department was visited to review building permits and site drawings pertaining to the subject site. The earliest records pertaining to the site was a building alteration permit issued to National Housing Agency on August 17, 1943. The permit stated that the alteration included the conversion of a market into eight apartments to house war workers. A demolition permit was issued to the Richfield Oil Corporation on March 7, 1950 to remove a one-story building on the site. A permit to construct a gasoline station was later issued to Richfield Oil Corporation on October 9, 1950. The building records also contained a scaled site plan of the Richfield Oil gasoline station showing the location of the four USTs, the fuel dispensers, and the building. This drawing was dated February 22, 1950.

A building permit to construct a two-story retail building issued to Mr. Curtis Thomas was filed on March 4, 1982, however, the permit was never finalized, and became expired on June 10, 1986. Several other permits were taken out by Mr. Thomas around the same time, none of which appeared finalized or approved by the City of Oakland Building Department.

Copies of the building permits, including the site plan of the former Richfield Oil gasoline station, are included in Appendix B.

4.2 Oakland Fire Department

The Oakland Fire Department records only date back two years according to information obtained from the Oakland Building Department. Accordingly, no information pertaining to the former gasoline station would be available from this agency.

4.3 Interviews

Mr. De Leon, the proprietor of the tire service business on the site, was interviewed regarding his knowledge of the former gasoline station. He stated in the interview, which was conducted on June 26, 1998, that he had no knowledge whether the former gasoline station's USTs were

removed from the site. Mr. Thomas, the former owner of the site, was also interviewed on June 26, 1998. Mr. Thomas indicated to the best of his knowledge, the USTs were removed from the site. However, he seemed to be unsure, and could not remember when the USTs were reportedly removed.

4.4 Aerial Photographs

Glenfos reviewed aerial photographs available from Pacific Aerial Survey Inc., Oakland, California, dated 1947, 1950, 1953, 1959, 1963, 1969, 1973, 1979, 1983, 1985, 1990, and 1996. Table 1 summarizes the finding of the aerial photograph review.

Table 1: Aerial Photograph Review

Date	Scale	Description
1947	1:20,000	The site is developed with a retail/residential building. The adjacent properties are developed with retail, commercial, and residential buildings similar to those observed during the site reconnaissance.
1950	1:7,200	The site and the adjacent properties are essentially unchanged from the previous photograph.
1953	1:10,000	The site is shown as a gasoline station. The configuration of the gasoline station building and dispenser island appears as shown in the 1950 map obtained from the Oakland Building Department. No significant changes were noted on the adjacent properties, except the property to the west, which appears as a parking lot.
1959	1:9,600	The site and the adjacent properties are essentially unchanged from the previous photograph.
1963	1:36,000	The site and the adjacent properties are essentially unchanged from the previous photographs.
1969	1:12,000	The site and the adjacent properties are essentially unchanged from the previous photographs.
1977	1:12,000	The site and the adjacent properties are essentially unchanged from the previous photographs.
1979	1:12,000	The site is essentially unchanged from the previous photographs. The only significant change on the adjacent properties a commercial building is now present west of the site.
1983	1:12,000	The site and the adjacent properties are essentially unchanged from the previous photographs.
1985	1:12,000	The site is developed with L-shaped commercial building similar in size and shape to the existing building on the site.
1990	1:12,000	The site and the adjacent properties are essentially unchanged from the previous photograph.
1996	1:12,000	The site and the adjacent properties are essentially unchanged from the previous photographs

Based on the aerial photograph review, the site appears to have been developed with retail/residential building from at least 1947 to 1950. A gas station was observed on the site from at least 1953 to at least 1983. By 1985 the site appears to have been developed with the building observed during the site reconnaissance. The adjacent properties appear to have also been developed back to 1947 with similar residential, retail, and commercial buildings to the ones observed during the site reconnaissance. No obvious gasoline stations were identified

within a quarter mile of the site in the aerial photographs that were reviewed.

4.5 Geophysical Survey

On June 26, 1998, Spectrum-Gasch Geophysics (Spectrum) conducted a geophysical investigation on the site in the area of the former gas station. The objective of this investigation was to locate possible subsurface structures of the former gasoline station, including USTs and product lines, and to provide utility clearance for the Phase II subsurface explanation. Spectrum utilized an EG&G Geometrics 856 AX proton-precession magnetometer, electromagnetic utility locators, and ground penetrating radar (GPR). Spectrum established a grid system for the site, spaced approximately ten feet in each direction, which was used to delineate areas of large ferromagnetic objects, such as USTs.

The findings of the geophysical survey included the identification of several high magnitude magnetic anomalies, all of which could be attributed to above ground cultural features such as a building, street light, phones, or to buried conduits. A 3,000 gamma monopole was identified on the site, and was interpreted to be an abandoned product line. Additionally, in the southeastern corner of the area investigated, a ten by twenty-foot area was located that contains buried metal debris. Spectrum stated in their report that the magnetic signature in this area was not consistent with that of a UST.

The anomalies located in the geophysical survey agreed with the underground structures of the former gasoline station as shown on the 1950 drawing. The area where Spectrum found the buried metal debris corresponds to the same area of the former UST tank pit. The observed product line anomaly runs from the northwest corner of the UST pit to the area of the former fuel dispenser. Although the product lines were not shown on the 1950 drawing, the configuration of the anomaly corresponding to the product line is consistent with its likely location beneath the site. Spectrum's report is included in Appendix C.

5.0 PHASE II ASSESSMENT

5.1 Preliminary Activities

5.1.1 Underground Service Alert of Northern California

On June 26, 1998, we notified Underground Service Alert of Northern California to mark the locations of known subsurface public utilities that entered the site. Our reference number is 169241.

5.2 Soil and Groundwater Sampling

Gregg Drilling was contracted to provide a geoprobe rig to collect the soil and groundwater samples from the site. The geoprobe sampling was conducted on July 9, 1998 and a Glenfos representative collected the samples and logged the geoprobe boreholes. Four probe locations (GP-1 through GP-4) were selected along the perimeter of the UST pit (and geophysical anomaly) shown on the 1950 map. Additionally, two probe locations (GP-5 and GP-6) were selected along the suspected product line, and two probe locations (GP-7 and GP-8) were selected in the area around the former fuel dispenser.

Soil samples were collected in clear acetate plastic liners that were inserted into the geoprobe sampler. The soil samples, which were collected at five-foot intervals, were sealed with teflon lined plastic caps, labeled, and immediately placed in a chilled ice chest. A portion of the sample was placed in a zip-locked plastic bag for headspace analysis using a photo ionization detector (PID). The PID used was a Thermal Environmental Instruments Inc., Model 580B OVM.

The geoprobe boreholes that encountered groundwater (GP-1, GP-4, GP-6, and GP-8) were sampled using a small portable peristaltic pump. The groundwater samples were retained in clean glass vials, labeled, and placed in a chilled ice chest.

All downhole sampling equipment was triple rinsed with each use to reduce the potential of cross contamination.

The soil and groundwater samples were delivered the next day to a state certified laboratory for chemical analysis. The analytical laboratory that was contracted for this work was American Analytic, located in Chatsworth, California.

5.3 Findings

5.3.1 Geoprobe Borings

Geoprobe soil sampling indicates that the site is underlain by sandy silt, clayey silt, and silty clay to a depth of approximately 20 feet. These soils were generally light to dark brown, or greyish brown in color, and very generally moist. A sandy gravel, with some clay, was encountered at a depth of 20 feet in borings GP-6 and GP-8, and was encountered at a depth of 25 feet in borings GP-3. The sandy gravel was light brown in color, and was found to be moist to saturated in the samples collected. Fill soils, consisting of a clayey gravel, was encountered in borings GP-1 and GP-4 from the ground surface to a depth of approximately 10 feet. This fill material, which is believed within the UST pit, was light brown in color, and was found to be moist to saturated in the samples collected.

Soil staining and petroleum odors were detected in some of the samples. Streaks of dark grey to greenish grey, and petroleum odor, were found in all of the borings except boring GP-1. The strongest petroleum odors and heaviest staining appeared in the samples collected from borings GP-6, GP-7, and GP-8, which were drilled in the areas of the suspected product line and the area of the former fuel dispenser island. Typically, the 10 and 15-foot samples showed the most evidence of petroleum impact.

The headspace monitoring detected the presence of volatile organic compounds (VOCs) in some of the collected soil samples. The highest headspace readings were as follows: GP-4 at 10 feet (466 parts per million - ppm); GP-6 at 10 feet (323 ppm); GP-3 at 10 feet (210 ppm); and GP-6 at 20 feet (136 ppm).

The boring logs are found in Appendix D. The locations of the borings can be found in Figure 2.

5.4 Laboratory Analyses

5.4.1 Analyses of Selected Soil Samples

Selected soil samples were analyzed by American Analytic for Total Petroleum Hydrocarbons - as gasoline (TPH-g) using EPA Modified Method 8015, and for the volatile fuel aromatic compounds benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020. Three soil samples were also analyzed for total lead using EPA Method 7420. Analytical reports and Chain-of-Custody documents are presented in Appendix E.

5.4.1 Analysis of Groundwater Samples

All four groundwater samples collected (GP-1, GP-4, GP-6, and GP-8) were analyzed by American Analytic for TPH-g using EPA Method 8015, and BTEX using EPA Method 8020. Two of the groundwater samples were also selected to be analyzed for total lead using EPA Method 7421. The water samples containing the highest BTEX was also tested for MTBE (a gasoline additive) by EPA 8260.

5.5 Laboratory Findings

5.5.1 Soil Samples

Based on the field observations of the soil samples and PID readings, 21 soil samples were selected for chemical analysis. The analytical results indicated the presence of TPH-g and BTEX in some of the analyzed samples. TPH-g was detected in all but four soil samples, and ranged in concentration from 1.5 milligram per kilogram (mg/kg) in the 10-foot sample collected from boring GP-2, to 190 mg/kg in the 15-foot sample collected in boring GP-6. Benzene was found in most of the samples, and ranged from non-detectable concentrations up to 0.59 mg/kg (GP-3@10). The highest concentrations of ethylbenzene (2.3 mg/kg), toluene (0.53 mg/kg), and xylene (4.7 mg/kg) were found in the 15-foot sample from GP6.

Three soil samples were selected to be analyzed for total lead. The analytical results indicated that total lead was detected in all three samples ranging from 4.1 mg/kg to 7.3 mg/kg. Those concentrations are considered to be low and likely the result of naturally occurring background levels.

Table 2 summarizes the soil analytical data. The complete analytical report is found in Appendix E.

5.5.2 Groundwater Samples

TPH-g and, BTEX, were detected in all four of the analyzed groundwater samples. TPH-g ranged from 0.17 milligrams per liter (mg/L) in the sample collected from GP-1, to 20 mg/L in the sample collected from GP-8. BTEX concentrations found in the groundwater were as follows: benzene from <0.5 microgram per liter - ug/L (GP-4) to 1,000 ug/L (GP-8); ethylbenzene from 0.58 ug/L (GP-4) to 420 (GP-8); toluene from <0.5 ug/L (GP-1 and GP-4) to 24 ug/L (GP-5); and xylene from <1 ug/L (GP-4) to 290 ug/L. Total lead was also analyzed in two of the four groundwater samples. The total lead concentrations were found to be 0.0095 mg/L (GP-8) and 0.011 (GP-4). *MTBE was also analyzed in GP-8 samples and was found to be below the detection limit of 10 ug/l.*

Table 3 summarizes groundwater analytical data. The complete analytical report is found in Appendix E.

6.0 CONCLUSIONS

At the request of Glendale Federal Bank., Glenfos has completed a Limited Phase I and Phase II environmental assessment of the site. The scope of our Limited Phase I Environmental Assessment was to review two previous environmental site assessments, review available building permits and drawings from the Oakland Building Department, review available records from the Oakland Fire Department, and conduct a geophysical survey.

The review of the previous environmental reports indicated that the site was formerly occupied by a Richfield Oil gasoline station from 1950 to at least 1976. Glenfos research of the site indicated that this gasoline station may have been present on the site to at least 1983, based on a review of historical aerial photographs. A 1950 site map of the former gasoline station was found at the Oakland Building Department. The site map depicted the location of four USTs in the area currently within the southwest corner of the site's parking lot, and a single fuel dispenser island within the northwest corner of the site's parking lot. The Oakland Fire Department records only date back two years, and accordingly, would not yield any records pertaining the former on-site gasoline station.

The geophysical survey found magnetic anomalies in the area of the suspected product lines and the USTs of the former gasoline station. Although the geophysical survey report indicated that the magnetic anomaly found in the area of the former USTs was not characteristic of a UST, the anomaly was found in the area of the USTs shown on the 1950 map. Hence the USTs may be still present in this area.

The scope of the Phase II assessment was to evaluate the potential for gasoline impacted soil and groundwater that may resulted from past use of the site as a gasoline station. The assessment included the collection of soil and groundwater samples in eight locations. The findings of the subsurface investigation revealed that the site's soil and groundwater have been impacted by gasoline. Up to 190 mg/kg of TPH-g, and 0.34 mg/kg of benzene, were found in some of the analyzed soil samples. The analysis of the groundwater samples indicated that TPH-g was

detected in the groundwater at a concentration up to 20 mg/kg. Additionally, up to 1,000 ug/L of benzene, 420 ug/L of ethylbenzene, 19 ug/L toluene, and 290 ug/L of xylene were also found in the groundwater beneath the site. Total lead was all found in the soil and groundwater beneath the site. None of the concentrations found in the analyzed samples appeared elevated, and may be natural occurring concentrations.

The highest concentration of gasoline hydrocarbons appear in the area of the former fuel dispenser and along the suspected product line.

7.0 RECOMMENDATIONS

Based on the data, the site has been impacted by a release of gasoline. The source of the gasoline appears to be from the former on-site gasoline station, since shallow soil contamination was found beneath the site (at a depth of 10 feet below grade), and the lack of off-site sources identified in the previous and current assessments. Hence, Glenfos recommends additional subsurface exploration to further refine the vertical and lateral extent to the impacted soil and groundwater. Should this investigation confirm the presence of these USTs, they should be removed from the site in accordance with local regulations.

8.0 CONFIDENTIALITY

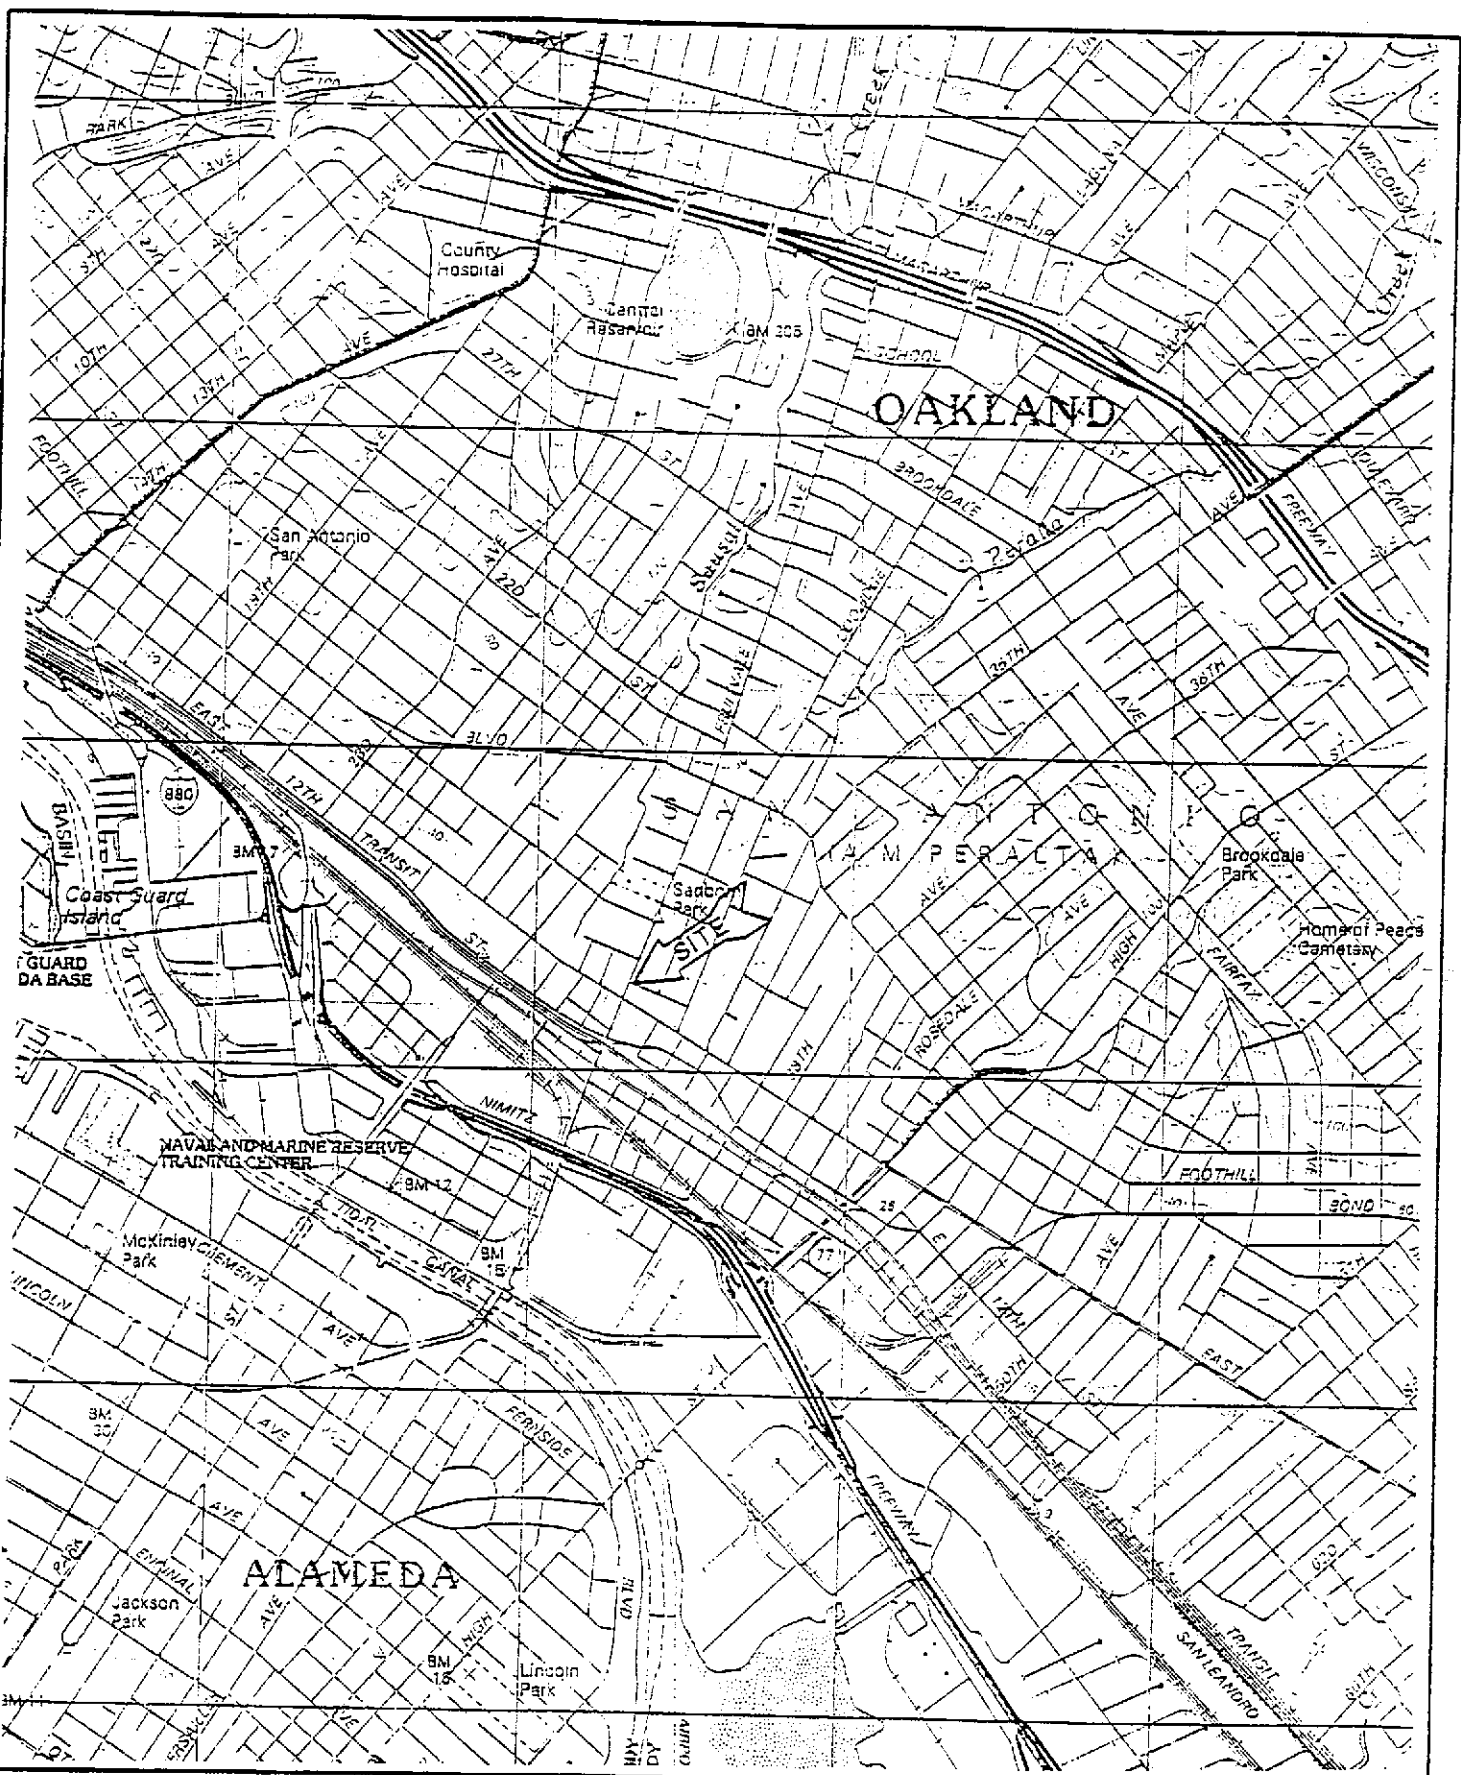

8.1 Liability Release

The professional opinions presented in this report have been developed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional advice included in this report. This report has been prepared for our client and their consultants, to be used solely in evaluating potential environmental implications at the site. This report has not been prepared for use by other parties, and may not contain sufficient information for purposes of other parties or other uses.

8.2 Confidentiality

Glenfos agrees to hold the information contained in this report or any portion thereof, confidential. This report, or information contained herein, will not be released to any party except as required by law, without consent from our client. Upon the approval of the client the report may be issued to any interested party.

Results of Geophysical Investigation
Parking Lot
1450 Fruitvale Avenue
Oakland, California

Introduction

On June 26, 1998 Spectrum-Gasch Geophysics conducted a geophysical investigation on a portion of a parking lot located at 1450 Fruitvale Avenue Oakland, California. The purpose was to identify the location of detectable underground storage tanks (USTs) and investigate twelve proposed exploratory boring sites (PEBS) for detectable subsurface interferences.

Methods

UST Investigation

The instruments selected for this investigation included an EG&G Geometrics 856 AX proton-precession magnetometer, electromagnetic utility-locators, and ground penetrating radar (GPR).

The total field magnetics method was employed in the effort to delineate areas where large ferromagnetic objects, such as USTs, may be buried. A grid of north/south traverses (Lines) spaced 10 feet apart was established with the sampling nodes demarcated with spray chalk at 10-foot intervals (Stations).

All data were stored internally within the instrument and transferred to a lap-top computer for processing. A total field magnetics contour map was generated in the field using Golden's Windsurf software. This map was used to identify anomalous areas of interest.

The geomagnetic activity for June 26, 1998 was reported by NOAA (National Oceanic and Atmospheric Association) as quiet to major storm. The background magnetics field strength was measured at approximately 48,000 gammas.

PEBS Investigation

- 1) We visually inspected the area surrounding each proposed exploratory boring site (PEBS) for evidence of subsurface utilities or other buried features and review available subsurface utility drawings.
- 2) Each identified utility within a radius of 5 feet was investigated using active electromagnetic utility-locating instruments and its surface trace demarcated on the ground using a color code established by the American Public Works Association (red for electric, blue for water, and etc.).
- 3) Each PEBS was investigated with a passive electromagnetic receiver tuned to 50/60 cycle electrical current to detect possible electrical lines (with voltages up to 30,000 volts) which may be nearby. The surface trace of detected electrical lines was demarcated on the ground using red spray paint.
- 4) Each PEBS was investigated with one operator holding an electromagnetic transmitter over the site while the other operator walked in a circle (with a radius of approximately 10 feet when practical) to detect increases in signal strength which would suggest possible subsurface utilities. Each suspect signal increase was further investigated to discern a signal propagating utility.
- 5) Each PEBS was investigated using a shallow focus terrain conductivity meter to identify possible buried and abandoned conduits as well as piping which may have no surface expression or which may be less than 20 feet in length.
- 6) Detected subsurface features were marked on the ground with spray paint in a color code established by the American Public Works Association. The PEBS were marked with 12-inch white spray-painted circles.

EXPLANATION

	Area of magnetics investigation		Water		Telephone
	Magnetics anomaly		Electric		Light post
	Proposed boring site		UST product		Buried metal debris
			Continued trend not determined		

Project Number: B9806261M

Date of Investigation:

June 25, 1998

Map by C. Carter

Not all below ground facilities may
 be represented on this map

Results

Several high magnitude magnetics anomalies were identified in the magnetics data, all of which could be attributed to above ground cultural features, such as the building or street light and phones, or to buried conduits (see Figure 2).

The 3,000 gamma monopole centered on Line 20 at Station 40 can be attributed to the detected and abandoned product conduit. The 1,200 gamma low centered on Line 10 at Station 10 can be attributed to an overhanging light.

In the southeastern corner of the area investigated we identified an 10 by 20-foot area that contains buried metal debris however, the magnetics signature of this area is not consistent with that of a UST. It is important to note that the source of the anomalous area cannot be known without excavation.
