**SUBJECT: Second Quarter 2014 Groundwater Monitoring Report for Fuel Leak Case  
No. RO0000324, Livermore Gas and Mini Mart, 160 Holmes Street,  
Livermore, California**

Dear Mr. and Mrs. Shuwayhat:

On your behalf, Allterra Environmental, Inc. (Allterra) has prepared this Second Quarter 2014 Groundwater Monitoring Report for the property located at 160 Holmes Street in Livermore, California (Site). This report describes the field and analytical methods, provides a summary of groundwater monitoring results, and presents conclusions and recommendations regarding groundwater conditions at the Site. Monitoring activities were completed in accordance with Alameda County Environmental Health Services (ACEHS) and Regional Water Quality Control Board (RWQCB) guidelines, and Allterra's protocols presented in Appendix A.

### **Site Location and Description**

The Site is located on the southwest corner of Holmes Street and 2nd Street at 160 Holmes Street in Livermore, California (Figure 1). The Site currently operates as a service station and convenience store. The Site is paved with concrete and asphalt, and a canopy covers the fuel dispensers. Pertinent site features, such as monitoring well locations, are presented on Figure 2.

### **Groundwater Monitoring for Second Quarter 2014**

#### Field Activities

On June 4 and 5, 2014, Allterra conducted groundwater monitoring at ten on- and off-site monitoring wells (MW-1B, MW-5A/B, MW-6, MW-7B/C, MW-8A/B, and MW-9A/B) and one on-site extraction/injection well (EW-1). Wells MW-1A, MW-2A, MW-3A, MW-4A, MW-7A, EW-2, EW-3, and EW-3B were all dry and therefore not sampled during this monitoring event. Groundwater monitoring activities included the measurement of static groundwater levels, an evaluation of groundwater in the wells for the presence of petroleum hydrocarbons, field parameter testing, and groundwater quality sampling. Prior to sampling, all groundwater wells were purged using disposable bailers until temperature, color, specific conductance, and turbidity readings had stabilized or until at least three casing volumes had been removed. Groundwater sampling field logs are included in Appendix B.

#### Laboratory Analysis

Groundwater samples collected from the wells were submitted under chain-of-custody documentation to McCampbell Analytical, Inc., of Pittsburg, California, a State of California certified laboratory (ELAP #1644). All samples were analyzed for total petroleum hydrocarbons

as gasoline (TPHg), and for benzene, toluene, ethylbenzene, xylenes (BTEX), and methyl tert-butyl ether (MTBE) by EPA Method 8021B/8015B. Additionally, select wells were tested for total petroleum hydrocarbons as diesel (TPHd) by EPA method 8015B; fuel oxygenates tert-amyl methyl ether (TAME), tert-butyl alcohol (TBA), di-isopropyl ether (DIPE), ethyl tert-butyl ether (ETBE), and MTBE by EPA Method 8260B; and lead scavengers 1,2-dibromoethane (EDB) and 1,2-dichloroethane (1,2-DCA) by EPA Method 8260B. Copies of the chain-of-custody documentation and the certified analytical report, including quality assurance and quality control (QA/QC) data, are included in Appendix C.

### Groundwater Gradient and Flow Direction

On June 4, 2014, Allterra personnel measured and recorded depths to groundwater from the tops of well casings (TOC) for each well. Recorded depths to groundwater ranged from 28.65 to 34.96 feet below TOC. The surveyed elevations of each well casing (measured in feet relative to mean sea level), depths to groundwater, and calculated groundwater elevations are presented in Table 1. The majority of the "A" zone wells were dry this monitoring event and consequently a representative groundwater potentiometric map could not be prepared with the limited data available. The first quarter (March 6, 2014) shallow groundwater potentiometric map is presented as Figure 3. For the March 2014 monitoring event, the general groundwater flow direction was to the northwest at a gradient of approximately 0.0061 feet per foot (ft/ft). Based on historic data trends, the lack of any significant rainfall, and the relatively short amount of time (approximately 3 months) between the first and second quarter monitoring events, it is unlikely that the groundwater flow direction and magnitude has changed significantly.

### Analytical Results

Petroleum constituents were detected in two of the eleven wells sampled during this event. A summary of current and historical groundwater analytical results is presented in Table 2. Additionally, current concentrations of dissolved TPHg, TPHd, benzene, MTBE, and TBA in groundwater are shown on Figures 4 through 7. Time trend plots for contaminant concentrations in wells MW-1A, EW-1, and EW-3 are shown on Figures 8 through 15. A discussion of current groundwater analytical results is presented below:

- TPHg was detected in one well (EW-1) at a concentration of 76 micrograms per liter ( $\mu\text{g/L}$ ).
- TPHd was detected in one well (EW-1) at a concentration of 100  $\mu\text{g/L}$ .
- Toluene was detected in one well (EW-1) at a concentration of 0.90  $\mu\text{g/L}$ .
- MTBE was detected in one well (EW-1) at a concentration of 490  $\mu\text{g/L}$ .
- TBA was detected in two wells at concentrations of 1,300  $\mu\text{g/L}$  in MW-7B and 29,000  $\mu\text{g/L}$  in EW-1.

- Benzene, ethylbenzene, xylenes, and lead scavengers were not detected at or above laboratory reporting limits in any wells sampled for these constituents this quarter.

## Conclusions

Based on the current groundwater monitoring data, Allterra concludes the following:

- Several “A” zone wells were dry during this monitoring event, which is likely the result of widespread drought conditions.
- Although a shallow groundwater potentiometric map was not prepared for this quarter we infer that the groundwater flow direction and gradient have not changed significantly since the March 2014 monitoring event (the general groundwater flow direction for the first quarter event was to the northwest at a gradient of approximately 0.0061 feet per foot (ft/ft)). This inference is based on historic data trends, the lack of any significant rainfall, and the relatively short amount of time (approximately 3 months) between the first and second quarter monitoring events.
- For the June 2014 monitoring event, petroleum constituents were detected at or above laboratory detection limits in two of the eleven wells sampled. The highest concentrations of petroleum constituents in shallow groundwater were detected in EW-1.
- TBA was detected in EW-1 at a concentration of 29,000 µg/L. Recent increases in TBA levels are likely due to degradation of MTBE caused by remedial activities and natural processes.
- Since April 2011, petroleum constituents in groundwater have generally exhibited stable to decreasing trends throughout the in-situ treatment zone. Substantial contaminant reduction has occurred in key wells MW-1A, EW-1, EW-3, and EW-3B located within the former source area.
- General stable to decreasing trends in petroleum constituents in shallow groundwater indicate that in-situ remedial efforts have been effective in treating soil and groundwater beneath the former source area at the Site.
- To date, there has been adequate source removal and remedial effort to consider this Site a low threat. Remaining petroleum impacts beneath and down-gradient of the Site do not currently pose a significant threat to human health, safety, or the environment and natural attenuation will allow further reduction of concentrations to the ultimate cleanup levels within a reasonable timeframe.

## **Recommendations**

Based on the conclusions presented above, Allterra recommends the following:

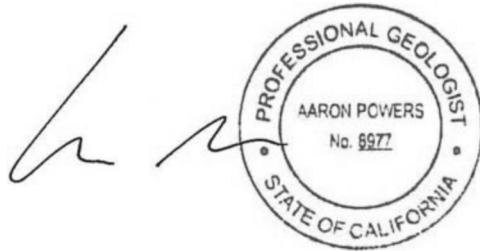

- Continue with the current quarterly groundwater monitoring at the Site to assess water quality under varying seasonal conditions until case closure is granted.
- During third quarter 2014, water level measurements will be performed prior to sampling activities. If the groundwater table remains low and the majority of "A" zone wells are still dry, no groundwater sampling will be performed during third quarter 2014.
- To reduce project costs, up-gradient wells MW-2A, MW-3A, and EW-2 and cross-gradient well MW-4A will continue to be sampled for TPHg, BTEX, and MTBE on an annual basis (first quarter of each year).
- All other wells will continue to be sampled and analyzed for TPHg, BTEX, and MTBE on a quarterly basis. Only select wells will be analyzed for TPHd, 5-fuel oxygenates, and lead scavengers on a quarterly basis.
- Evaluate the Site as a potential candidate for case closure.

## **Limitations**

Allterra prepared this report for the use of Livermore Gas and Mini Mart, ACEHS and RWQCB in evaluating groundwater quality at selected locations at the time of this study. Statements, conclusions, and recommendations in this report are based solely on the field observations and analytical results related to work performed by Allterra and there is no warranty, expressed or implied. Site conditions and data can change over time; therefore, data presented in this report is only applicable to the timeframe of this study. Allterra's services have been performed in accordance with environmental principles generally accepted at this time and location.

Should you have any questions, please contact Allterra at (831) 425-2608.

Sincerely,  
Allterra Environmental, Inc.

Notes:

msl = mean sea level

bgs = below ground surface

NC = elevation not calculated

NM = well not measured

\* = Well MW-1, 2, and 3 renamed MW-1A, 2A, and 3A respectively

\*\* = Well destroyed on 2/22/06-2/28/06

\*\*\* = Well installed on 2/22/06-2/28/06

(a) = Well EW-3 is 35 feet deep with screen interval from 25 to 30 feet bgs.

(b) = Well EW-3B installed 3/5/13 with screen interval from 24 to 39 feet bgs.

Notes:

$\mu\text{g/L}$  = micrograms per liter

NC = Not Calculated

NS = Not Sampled

-- = Not Analyzed

EDB = 1,2-Dibromoether

1,2-DCA = 1,2-Dichloroethane

MTBE = Methyl tertiary butyl ether

DIPE = Di-isopropyl Ether

ETBE = Ethyl tert-Butyl Ether

TAME = tert-Amyl Methyl Ether

TBA = tert-Butanol

" = High concentrations of MTBE resulted in high reporting limits, both TPHg and benzene were estimated just below listed reporting limits by laboratory.

\* = Well MW-1 renamed MW-1A, well MW-2 renamed MW-2A, Well MW-3 renamed MW-3A in February 2006.

\*\* = Well destroyed in February 2006.

\*\*\* = Anomalous data observed in MW-7C on October 12, 2006. Therefore, MW-7A/B/C were resampled on November 21, 2006.

(a) = Well EW-3 is 35 feet deep with a screen interval from 25 to 30 feet bgs.

(b) = Well EW-3B is 39 feet deep with a screen interval from 24 to 39 feet bgs.

Samples analyzed for TPHg and TPHd by EPA Method 8015Bm, BTEX by EPA Method 8021B, MTBE by EPA Method 8021B and/or 8260B, fuel oxygenates and lead scavengers by EPA Method 8260B, and hexavalent chromium by EPA Method E200.8.

**APPENDIX A**  
Groundwater Monitoring Field Protocol

## **Appendix A**

### Groundwater Monitoring Protocol

#### Well Monitoring and Sample Collection

A Teflon bailer or submersible pump was used to purge a minimum of three well volumes of groundwater from each well. After each well volume is purged, field parameters such as pH, temperature, and conductivity are recorded. Wells are purged until field parameters have stabilized or a maximum of ten (10) well volumes of groundwater have been removed. When possible, purge rates will not exceed the recharge rate for the well. However, if the well yield is low and the well was dewatered, the well is allowed to recharge to 80% of its original volume prior to sample collection. Field parameter measurements and pertinent qualitative observations, such as groundwater color and odor, are recorded in Groundwater Sampling Field Logs. Groundwater samples are collected in appropriate bottles and stored on ice for delivery, under chain-of-custody documentation, to a state-certified laboratory for analysis.

#### Equipment Decontamination

All drilling, sampling, and well development equipment was cleaned in a solution of laboratory grade detergent and distilled water or steam cleaned before use at each sampling point.

#### Field Personnel

During groundwater sampling activities, sampling personnel will wear pertinent attire to minimize risks to health and safety. Field personnel will also use a pair of clean, powderless, surgical gloves for each successive sampling point. Used surgical gloves will be placed into waste barrels for future disposal.

#### Waste Disposal

Water generated during well purging and sampling activities will be placed into DOT-approved 55-gallon waste drums. Waste drums will be temporarily stored on-site pending proper disposal of wastewater to an approved transport, storage, and disposal (TSD) facility.

***The report shall not be reproduced except in full, without the written approval of the laboratory.  
The analytical results relate only to the items tested. Results reported conform to the most  
current NELAP standards, where applicable, unless otherwise stated in the case narrative.***

## Glossary of Terms & Qualifier Definitions

**Client:** Allterra Environmental  
**Project:** #160; 160 Holmes  
**WorkOrder:** 1406349

### Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Matrix interferences, or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix; or sample diluted due to high matrix or analyte content.
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

### Analytical Qualifiers

d1	weakly modified or unmodified gasoline is significant
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

## Analytical Report

**Client:** Allterra Environmental  
**Project:** #160; 160 Holmes  
**Date Received:** 6/10/14 22:15  
**Date Prepared:** 6/12/14-6/13/14

**WorkOrder:** 1406349  
**Extraction Method:** SW5030B  
**Analytical Method:** SW8260B  
**Unit:** µg/L
