Re: **Site Investigation and Pilot Test Report, and Corrective Action Plan**
Former Shell Service Station
461 8th Street
Oakland, California
SAP Code 129453
Incident No. 97093399
ACHCSA Case No. 0343

Dear Mr. Wickham:

Conestoga-Rovers & Associates (CRA) prepared this report on behalf of Equilon Enterprises LLC dba Shell Oil Products US (Shell) to document the recent investigation and pilot testing conducted at the referenced site. The scope of work is described in the May 25, 2008 Remedial Alternatives Evaluation, Site Investigation, and Dual-Phase Extraction Pilot Test Work Plan and in the October 30, 2007 Work Plan Addendum (work plans). The Alameda County Health Care Services Agency (ACHCSA) approved of the scope in their October 19, 2007 and November 9, 2007 letters to Shell.

SITE DESCRIPTION AND BACKGROUND

The site is currently a paved parking lot located at the southwest corner of the intersection of 8th Street and Broadway in Oakland, California (Figures 1 and 2). The property was leased by American Oil Company from at least 1965 until 1972 when the lease was assigned to Shell Oil Products Company (Shell). A Shell service station operated on the property from 1972 to 1980. The underground storage tanks (USTs) associated with the former Shell service station were removed after Shell terminated operations at the site in May 1980. The subject site is used for paid public parking, and as of the date of this document, is up for sale.

A summary of previous work performed at the site and additional background information is contained in Attachment A. The site plan and historical sample locations are depicted on Figure 2.

SITE INVESTIGATION

Permits:

Drilling permits were obtained from the Alameda County Public Works Agency (W2007-1113 through W2007-1119, and W2007-1236). Copies of the permits are included in Attachment B.

Drilling Dates:

November 30, December 3, and December 11 through December 13, 2007.

Drilling Company:

Gregg Drilling.

Personnel:

CRA staff Lauren Goldfinch and Carmen Rodriguez directed the drilling activities. All work was performed under the supervision of California Professional Geologist Ana Friel.

Drilling Method:

Direct Push/Hollow-Stem Auger.

Number of Borings:

Four borings (B-24 through B-27) were drilled, and soil vapor probes VP-1 through VP-4, respectively, were installed in the borings. Additionally, five groundwater monitoring wells (S-12 through S-16) and one air sparging well (AS-1) were installed. Boring logs and well construction diagrams are included in Attachment C. The boring and well locations are shown on Figure 2.

Boring Depths:

Borings B-24 through B-27 were drilled to depths ranging from 14 to 37 feet below grade (fbg). The work plan (May 25, 2007) recommended continuing all of the borings to approximately 50 fbg. However, drilling refusal was encountered in the boring. Well borings S-12 through S-16 and AS-1 were drilled to depths ranging from 35 to 36.5 fbg.

Groundwater Depths:

Groundwater was first encountered at depths ranging from 24 to 32 fbg.

Monitoring Well Construction: As approved in a December 6, 2007 electronic correspondence from the ACHCSA, monitoring wells S-12 and S-13 were constructed with screen intervals from 20 to 35 fbg, and wells S-14, S-15, and S-16 with screen

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

intervals from 15 to 35 fbg. Air sparging well AS-1 was constructed screening from 30 to 32 fbg. Well construction details are shown on the boring logs in Attachment C.

Vapor Probe Construction: As requested in the November 9, 2007 ACHCSA letter to Shell, permanent soil vapor probes VP-1 through VP-4 were installed within soil borings B-24 through B-27, respectively. Each vapor probe contains two screen intervals from 4.5 to 5 fbg and from 9 to 9.5 fbg, with clean filter pack from 4.5 to 5.5 fbg and from 9 to 10 fbg. A bentonite seal extends between the two filter pack intervals. The construction details are included on the boring logs in Attachment C.

Soil Disposal: The disposal documentation is included in Attachment D.

Analytical Results

Soil Results: The soil analytical data are presented on Table 1, and total petroleum hydrocarbons as gasoline (TPHg) and benzene concentrations are shown on Figure 3. Certified analytical reports are included in Attachment E.

Grab Groundwater Results: The grab groundwater analytical data are presented on Table 2, and the TPHg and benzene concentrations are shown on Figure 3. Certified analytical reports are included in Attachment E.

Soil Vapor Results: Soil vapor samples were collected from each screen interval in vapor probes VP-1 through VP-4 on December 11, 2007. Soil vapor analytical data are presented on Table 3, and the TPHg and benzene concentrations are shown on Figure 4. Certified analytical reports are included in Attachment E.

Further discussion of the distribution of petroleum hydrocarbons in soil, groundwater, and soil vapor beneath the site are included in the draft Corrective Action Plan (CAP) below.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

DUAL-PHASE EXTRACTION PILOT TEST

As described in CRA's work plans, CRA conducted a Dual-Phase Extraction (DPE) pilot test to investigate feasible soil and groundwater remediation methods for this site. DPE testing utilized existing wells S-8, S-9, and the new wells described above. The following were the objectives of the DPE pilot test:

- 1) Ascertain if DPE is a feasible remediation alternative by:
 - a) determining the DPE flow rate that site soils will yield,
 - b) determining the magnitude and sustenance of hydrocarbon vapor concentrations,
 - c) determining the vacuum radius of influence
- 2) Provide source area remediation of residual petroleum hydrocarbons.
- 3) Obtain site specific data for use in a DPE system design, if necessary

DPE Equipment: A trailer-mounted Solleco 300ECAT unit powered by a 125 kilowatt diesel generator was used for conducting the DPE test. The Solleco unit included a liquid-ring pump driven by a 20-horsepower motor. The electric catalytic oxidizer was used as the vapor abatement device during the pilot test. An extraction hose from the Solleco unit was sealed to the extraction wells at a pre-constructed manifold. The Solleco unit was equipped with manual dilution and throttle valves for vacuum and flow control. Water from a knockout tank on the trailer was pumped into a 20,000 gallon Baker tank.

Field vapor concentrations were measured with a Horiba Vapor Analyzer. Vapor samples were collected in one-liter teflon bags using a Gast rotary-vane sample pump. The induced vacuum in the observation wells, the casing vacuum in the extraction well, the line vacuum, system vacuum, and pump vacuum were measured using Magnehelic differential pressure gauges. The oxidizer temperature was read from a digital readout mounted on the trailer.

DPE Data Collection and Sampling: Data was collected on standard forms. Throughout the DPE pilot test, CRA measured the blower vacuum, system vacuum, line vacuum, well flow, system flow, observation well induced vacuums, extraction well casing vacuum, depth-to-water, and volatile organic vapor concentrations in the influent and effluent streams. Depth to water was measured at static levels and periodically throughout testing to determine drawdown. Samples of the extracted soil vapor were collected several times during testing for analysis at an analytical laboratory.

Analyses: All laboratory samples were analyzed by KIFF Analytical LLC in Davis, a State of California certified laboratory. Samples were analyzed for TPHg and BTEX by EPA Method 8260B.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

DPE Pilot Test Results

DPE vapor-phase mass removal is summarized in Table 4. DPE observation data is summarized in Table 5. Vacuum radius of influence data is summarized in Table 6. Laboratory analytical reports are included as Attachment F.

CRA mobilized the DPE equipment to the site on January 7, 2008. This day was dedicated to setting up equipment and collecting static (baseline) data. Additionally, the Solleco unit required some minor repairs in addition to standard maintenance.

DPE testing began on January 8, 2008. Wells S-8 and S-14 were tested. CRA first conducted a step test on well S-8 to determine the vacuum setting that would yield the highest flow rate. It was determined quickly that the maximum pump vacuum was required to keep the well dewatered due to well depth and groundwater production. Well S-14 was then tested at the maximum vacuum setting and allowed to operate overnight.

Well S-14 testing was completed on the morning of January 9, 2008. Short-term testing of wells S-9, S-13, and S-16 was conducted on this day as well. CRA stopped DPE testing after testing the final well to allow the subsurface to equilibrate prior to air sparge testing.

Vapor Concentrations: TPHg and BTEX concentrations varied at each extraction well throughout DPE testing. Vapor samples were collected at the beginning and end of testing for each extraction well. Vapor concentrations were moderate in all wells, except for well S-9 which had low vapor concentrations. Well S-14 was the only well extracted from overnight. TPHg concentrations dropped from 3,500 ppmv to 1,700 ppmv at the end of the long term test (17.8 hours).

Vacuum and (Air) Flow: The applied vacuum and flow rate are listed in Table 4. Flow rates varied from 10 to 30 standard cubic feet per minute (scfm). It was evident during testing that the well depth, screen interval, and groundwater production affected the flow rate. Given the soil types (fine-grained sands) encountered at this site, CRA believes slightly higher flow rates can be attained by using a downwell pump and wellhead vapor extraction connection versus a stinger

Mass Removal: Based on operating parameters and vapor sample analytical results, the total vapor-phase mass removed from each extraction well is summarized below.

TABLE A – VAPOR PHASE MASS REMOVED

Well	TPHg	Benzene	Ethyl benzene	Toluene	Xylene
	(lbs)	(lbs)	(lbs)	(lbs)	(lbs)
S-8	20.4	0.139	0.049	0.030	0.044
S-14	127	3.61	0.135	3.92	0.610
S-9	2.44	0.014	0.015	0.020	0.053
S-16	26.2	0.393	0.131	0.577	0.527
S-13	46.7	0.452	0.423	1.01	2.05
Total	223	4.61	0.753	5.56	3.28

It is clear that wells S-13 and S-16 with slightly higher vapor concentrations has the highest hydrocarbon mass removal rate. The largest mass removal was from well S-14, which is attributed to the longest testing time.

Groundwater samples have not been collected from the new wells at this time. Therefore, dissolved-phase hydrocarbon mass removal has not been calculated. CRA assumes the dissolved-phase hydrocarbon mass removed will be low relative to the vapor-phase hydrocarbon mass removed.

Vacuum Radius of Influence: Table 6 presents the vacuum radius of influence (ROI) data and the effective ROI calculation. The theoretical ROI is estimated according to the steady-state radial distribution equation in *A Practical Approach to the Design, Operation, and Monitoring of In Situ Soil Venting Systems* (P.C. Johnson, C.C. Stanley, M.W. Kemblowski, D.L. Byers, and J.D. Colthart, Groundwater Monitoring and Review, Spring 1990). The theoretical ROI is estimated to be as much as 60 feet, but more consistently around 45 feet.

Groundwater Production and Drawdown: CRA initially used a flow totalizing meter to measure groundwater production. However, silt production continually plugged this meter and inhibited continuous operation. Sufficient data was gathered during testing of well S-8 to assess groundwater production. Well S-8 produced approximately 520 gallons over 156 minutes, which equates to approximately 3.33 gallons per minute (gpm). CRA observed similar production from the other wells. Based on disposal records, approximately 6,045 gallons of groundwater was removed over the course of DPE testing (1770 minutes), which equates to 3.42 gpm.

Drawdown data is presented in Table 5. Static water levels were measured at approximately 23 fbg. All wells, except for well S-14, were dewatered to near the bottom of the well (30 to 35 fbg). Drawdown

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

was consistently observed in all wells ranging from approximately 1 to 2.5 feet depending on its distance from the extraction well.

AIR SPARGING PILOT TEST

As described in CRA's work plans, CRA conducted an Air Sparge (AS) pilot test to investigate feasible soil and groundwater remediation methods for this site. AS testing utilized new well AS-1, existing wells S-8, S-9, and the new wells previously described. The following were the objectives of the AS pilot test:

- 1) Ascertain if AS is a feasible remediation alternative by:
 - a) determining if sufficient air could be delivered and properly distributed to the impacted area,
 - b) determining maximum air injection flow rate,
 - c) determining the magnitude and sustenance of hydrocarbon vapor concentrations
- 2) Provide source area remediation of residual petroleum hydrocarbons.
- 3) Obtain site specific data for use in a AS system design, if necessary

AS Equipment: A Mako Industries, Ltd air sparge trailer with a rotary screw air compressor capable of 28 cfm and 125 psi was used for conducting the AS test. An air hose was attached to the injection well from a pre-constructed manifold. Two 10 cfm air rotameters were mounted in the AS trailer to measure air flow. The air compressor was powered using the same generator used for the DPE pilot test.

Field vapor concentrations were measured with a Horiba Model MEXA554J organic vapor analyzer (OVA) with calibration gas. Vapor samples were collected in one-liter tedlar bags using a Gast rotary-vane sample pump model 907CDC18F. The induced pressure in adjacent wells was measured with Magnehelic pressure gauges. Five YSI 600 XLM pressure transducer and data loggers provided by Equipco, Inc recorded bioparameters and water levels in monitoring wells.

Procedure: Data loggers were set in observation wells S-8, S-13, S-14, S-15, and S-16 to continuously record DO concentrations, pH, and water levels. Magnehelic pressure gauges were fitted to observation wells to differentiate water level changes from induced pressure from sparge air migration. Prior to testing, vapor samples were collected from the observation wells to establish the background hydrocarbon vapor concentrations.

To assess effectiveness of AS, air was injected into well AS-1 using an air compressor. Injection pressure and air flow were monitored at the manifold. The initial injection pressure was to be set at the 5

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

psi. The pressure was then incrementally increased to the maximum injection pressure, which was established as 75% of the overburden pressure. The over burden pressure was calculated as follows:

The hydrostatic pressure (P_H) was determined using the following equation:

$$P_H = (\text{Water column above top of screen})(\text{Specific Weight}_{\text{WATER}})$$

The static depth-to-water in well AS-1 was measured at 23 fbg. The top of the screened interval for well AS-1 is at 30 fbg. Therefore, the water column above the top of screen was 7.0 feet. The specific weight of water is 62.4 pounds per cubic foot. Therefore, the hydrostatic pressure equated to:

$$P_H = (7.0 \text{ feet})(62.4 \text{ pounds/cu ft})(1 \text{ sq ft}/144 \text{ sq inches}) = 3.03 \text{ psi}$$

The overburden pressure (P_{OB}) was determined using the following equation:

$$P_{OB} = P_H + P_{SOIL} \quad \text{where:}$$

$$P_{SOIL} = (\text{Soil column above top of screen})(\text{Specific Gravity}_{\text{SOIL}})(1-\text{porosity})(\text{weight of soil})$$

As stated above, the top of the screened interval for well AS-1 is at 30 fbg. The specific gravity and porosity of soil is estimated at 2.7 and 0.40. The unit weight of soil is taken as 90 pounds per cubic foot. Using this data, the soil pressure equates to:

$$P_{SOIL} = (30 \text{ feet})(2.7)(1 - 0.40)(90)(1 \text{ square foot}/144 \text{ square inches}) = 30.4 \text{ psi}$$

Using the equation above, the overburden pressure equated to:

$$P_{OB} = P_H + P_{SOIL} = 3.0 \text{ psi} + 30.4 \text{ psi} = 33.4 \text{ psi}$$

The maximum injection pressure was taken as 75% of the overburden pressure, which equates to 25.1 psi. Therefore, the injection pressure range for this test was established as 5 to 25 psi. Air flow was monitored at each applied pressure interval.

Observation wells were fitted with pressure gauges to differentiate water level changes from pressure induced by sparge air migration. Hydrocarbon vapor concentrations were periodically field-measured and vapor samples were collected from each observation well for laboratory analysis to assess volatilization of hydrocarbons from groundwater and soils. Depth to water was periodically measured in observation wells.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

Data Collection and Sampling: Data was collected on standard forms. Depth to water was measured to determine the initial groundwater levels. Throughout the gas injection pilot test, CRA personnel measured the applied pressure, flow, volatile organic vapor concentration and pressure influence in nearby wells at 30 minute intervals. Samples of observation well soil vapors were collected several times during testing for analysis at an analytical laboratory. As previously stated, transducers and pressure gauges were installed at select observation wells to record bioparameter, induced pressure, and water level data.

Analyses: All laboratory samples were analyzed by KIFF Analytical LLC in Davis, a State of California certified laboratory. Samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg) and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Method 8260B.

AS Pilot Test Results

AS testing began on January 10 and was completed on January 11, 2008. AS testing was not conducted overnight. Table 7 presents the AS test data. Laboratory analytical reports are included as Attachment F. Transducers data is included as Attachment G.

Pressure and Flow: As stated, injection pressures were increased step-wise in 5 pound per square inch (psi) increments from 5 to 25 psi. The minimum flow rate (~15 cfm) considered to be the criteria for AS feasibility was achieved at an injection pressure of approximately 20 psi. A flow rate of 20 cfm was achieved at the maximum injection pressure of 25 psi.

Vapor Concentrations: TPHg and benzene analytical data are included in Table 7. Graphs 1 and 2 illustrate the changes in TPHg and benzene (respectively) vapor concentrations over the course of testing. An increasing concentration trend was apparent in all wells during the first day of testing. Concentrations showed increases with time and with each increase in air injection pressure. Vapor concentrations were high during the second day of testing, but dropped during the last step at 25 psi. Higher vapor concentrations were encountered during AS testing versus DPE testing.

Water Levels: The maximum water level change for each observation well occurred during the second day of the AS pilot test, which was expected due to water mounding at the higher injection pressures. Manual depth-to-water measurements and water level changes are presented in Table 7. Graph 3 illustrates the changes in water level recorded by the transducers over the course of testing on January 11, 2008. The maximum water level rise in wells S-14, S-15, and S-16 was approximately 9, 6.5, and 3 feet,

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

respectively. The differences varied based on their distance from the injection well; a decreasing water level rise with increasing distance from the injection well.

Bio-parameters: The transducer data includes DO, temperature, pH, specific conductance, oxygen reduction potential (ORP), and DO saturation percentage. DO data from well S-8 lies just within the aerobic range (DO = 3 to 5 mg/L). The DO data from well S-14 is well above the aerobic range. This may be attributed to the short distance from the injection well. DO in wells S-13, S-15 and S-16 are below the aerobic range. This may be due to high hydrocarbon concentrations in soil and groundwater in these areas. Graph 4 illustrates the DO trend recorded by the transducers during AS testing on January 11, 2008.

Conclusions

The pilot test results show that both DPE and AS are technically feasible based on the previously discussed criteria. However, DPE testing indicated that significant dewatering would be necessary to maximize its effectiveness. This would come at a higher cost and greater consumption of resources (ie sewer capacity, electricity, and carbon). Furthermore, higher vapor concentrations were recovered during AS testing than DPE. Therefore, vapor-phase mass removal will be greater with an SVE/AS system versus a DPE at a lower cost. Lastly, installation or relocation of a SVE/AS system would be easier and less expensive than a DPE system in accommodating future site development.

CORRECTIVE ACTION PLAN

Site Geology and Hydrogeology

Soil Types: United States Geological Survey (USGS) publications and maps indicate that the area is underlain by the Merritt Sand (*Areal and Engineering Geology of the Oakland West Quadrangle, California*, D.H. Radbruch, USGS, *Miscellaneous Geological Investigations, Map I-239*, 1957, and *Geologic Map and Map Database of the Oakland Metropolitan Area, Alameda, Contra Costa, and San Francisco Counties, California*, USGS R.W. Graymer, 2000). Previous site investigations indicated that subsurface materials encountered consist primarily of fine-grained sand, which is consistent with the description of the Merritt Sand formation, as well as silt, and silty sands.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

Groundwater Elevation and Gradient: Groundwater has been first encountered during drilling at the site at depths ranging from approximately 24 to 32 fbg. Depth to groundwater in site monitoring wells has ranged historically from approximately 12.8 to 25.8 fbg. Groundwater elevations have ranged from approximately 8.1 to 16.0 feet above mean sea level since 2002 when the site was resurveyed. Groundwater flow direction has ranged historically from southwest to south-southeast at a gradient ranging from 0.005 to 0.020.

Distribution of Petroleum Hydrocarbons

Hydrocarbon Distribution in Soil: Soil analytical data collected since 2003 is summarized on Table 1.

During July 1994, nine soil borings (B-1 through B-9) were drilled at the site. TPHg was detected at concentrations of 15 milligrams per kilogram (mg/Kg) and 14 mg/Kg in soil samples collected from 10 fbg in soil borings B-4 and B-7 only. Benzene was detected at 0.24 mg/Kg in the 10 fbg sample collected from boring B-7 only. During December 1994, three onsite monitoring wells (S-8, S-9, and S-10) were installed. TPHg was detected in the soil sample collected from 10 fbg in well S-10 only. Benzene concentrations were near or below reporting limits in all of the soil samples collected.

During December 2006, twenty four soil borings (B-10 through B-23) were drilled onsite. TPHg and benzene, toluene, ethylbenzene, and xylenes (BTEX) concentrations were near or below reporting limits in all of the unsaturated soil samples collected from the borings, except boring B-12 and, to a lesser extent, boring B-13. The highest TPHg and benzene concentrations were detected in soil samples collected from between 10 to 20 fbg in boring B-12. Borings B-12 and B-13 are located along the former piping run adjacent to the southeastern-most former dispenser islands. TPHg and benzene were detected at concentrations ranging from 1,800 to 7,800 mg/Kg, and 7.0 to 49 mg/Kg, respectively, in the saturated soil samples collected from borings B-10, B-11, B-22, and B-23, located in the southeastern portion of the site. These concentrations may be more indicative of groundwater conditions, however. TPHg and BTEX concentrations were near or below reporting limits in the soil samples collected from borings B-14 through B-21, all located in the northwestern portion of the site.

During December 2007, four soil borings (B-24 through B-27) were drilled, and five groundwater monitoring wells (S-12 through S-16), and one air sparging well (AS-1) were installed onsite. TPHg and BTEX concentrations were near or below reporting limits in the soil samples collected from borings B-25, B-26, B-27, and in well borings S-12 and S-13, all located along the southwestern property boundary. TPHg and BTEX were also near or below reporting limits in unsaturated soil samples collected from boring B-24, and from well borings S-14 and S-16. TPHg and benzene concentrations in unsaturated soil samples from well borings S-15 and AS-1 ranged from 6.5 to 5,000 mg/L, and from

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

below reporting limits to 93 mg/L, respectively. The highest concentrations were detected in soil samples collected between 10 to 20 fbg.

Fuel oxygenates have not typically been detected in soil at the site.

Hydrocarbon Distribution in Groundwater: Historical groundwater analytical data is included in Attachment H, and grab groundwater analytical data collected since 2003 is summarized on Table 2.

Prior to the December 2007 investigation activities, there were three onsite monitoring wells (S-8, S-9, and S-10) and three offsite monitoring wells (S-4, S-5, and S-6) associated with the site. Sampling of well S-5 was discontinued during 2004 because the well is installed within a storm drain vault and confined space entry is required for access. Three additional monitoring wells (S-12, S-13, and S-14) were installed during January 2008, and will be added to the groundwater monitoring schedule at the site beginning in February 2008. New wells S-12, S-13, and S-14 were installed adjacent to previously collected grab groundwater samples from borings B-21, B-22, and B-23, respectively.

TPHg and benzene concentrations in onsite wells S-8 and S-10 have shown a decreasing trend since approximately 1997 and have been near or below reporting limits since approximately 2005. TPHg and benzene concentrations in well S-9, located in the southern corner of the site, showed a decreasing trend beginning in 1998, and were near or below reporting limits from approximately 1999 through approximately 2005. TPHg and benzene concentrations in well S-9 showed an increase during the third quarter 2006 event, and have since remained stable. During the third quarter 2007 monitoring event, TPHg and benzene concentrations in well S-9 were 9,800 µg/L and 2,400 µg/L, respectively.

TPHg and BTEX concentrations have historically been near or below reporting limits in offsite well S-4, located across Broadway from the site. TPHg and BTEX concentrations have historically been highest in offsite wells S-5 and S-6.

During December 2006, grab groundwater samples were collected from borings B-10 through B-24. TPHg and benzene concentrations in grab groundwater samples collected from the borings, with the exception of B-20, ranged from 320 to 270,000 micrograms per liter (µg/L), and from 7.7 to 24,000 µg/L, respectively. The grab groundwater sample from boring B-20 did not contain TPHg, BTEX, or fuel oxygenates.

Hydrocarbon Distribution in Soil Vapor: During December 2007, four permanent soil vapor probes were installed at the site, each with separate screen intervals at approximately 5 and 9.5 fbg. Soil vapor analytical data is summarized on Table 3.

CONESTOGA-ROVERS
& ASSOCIATES

Mr. Jerry Wickham
February 25, 2008

TPHg and BTEX concentrations were near or below reporting limits in both screen intervals for soil vapor probes VP-2 through VP-4. The soil vapor sample from the deeper screen interval for probe VP-1 contained 160,000 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) TPHg and 9,600 $\mu\text{g}/\text{m}^3$ benzene. The shallow screen interval for probe VP-1 did not contain TPHg above the reporting limit of 19,000 $\mu\text{g}/\text{m}^3$, and contained 170 $\mu\text{g}/\text{m}^3$ benzene, indicating significant vertical attenuation of TPHg and benzene toward the surface.

Tier I Risk Assessment

As a Tier 1 risk assessment, results of chemical analysis of soil, groundwater, and soil vapor samples were compared to published San Francisco Bay Regional Water Quality Control Board (RWQCB) ESLs for TPHg, and BTEX. The following tables present the maximum detected soil concentrations, the current groundwater concentrations, the most recent soil vapor concentrations, and RWQCB ESLs (revised November 2007) for the COCs. While no drinking water wells have been identified in the vicinity of the site, ESLs were groundwater is a current or potential source of drinking water were used as a conservative comparison.

COC	Soil		Groundwater		Soil Vapor	
	Concentration (a)	ESL (b)	Concentration (c)	ESL (b)	Concentration (d)	ESL (e)
	mg/kg	mg/kg	mg/kg	mg/kg	$\mu\text{g}/\text{L}$	$\mu\text{g}/\text{L}$
TPHg	5,000	83	57,000	100	160,000	29,000

Notes:

(a) Concentrations in soil based on highest detections in shallow (less than 3 meters or 9.84 feet) soil samples.

(b) ESLs are *Table A Shallow Soil and Groundwater ESLs (Groundwater is a current or potential source of drinking water)*.

(c) Concentrations in groundwater based on highest detections during 2007 sampling events from groundwater monitoring wells. Grab groundwater analytical results were not used.

(d) Concentrations in soil vapor based on highest detection during December 2007 sampling event.

(e) ESLs are *Table E-2 Shallow Soil Gas Screening Levels for Evaluation of Potential Vapor Intrusion Concerns (volatile chemicals only) – Commercial/Industrial Land Use*.

Bold designates exceedences to the respective residential ESL.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

Surface Soil: The highest COC concentrations detected in unsaturated soil samples were found in samples collected in the vicinity southeastern former dispenser islands and adjacent former product piping (i.e. borings B-12, S-15, and AS-1). TPHg, and BTEX concentrations were detected above the respective residential ESLs. TPHg and BTEX concentrations detected in saturated soil samples may be more representative of groundwater conditions.

Groundwater: The highest concentrations from site monitoring wells during 2007 sampling events were used for the Tier 1 RBCA analysis. TPHg and BTEX concentrations in groundwater are above the respective residential ESLs. Historically, the highest TPHg and BTEX concentrations have been detected in offsite wells S-5 and S-6. Newly installed onsite wells S-12 through S-16 will be sampled during the first quarter 2008 monitoring event.

Soil Vapor: The highest TPHg and benzene concentration in soil vapor, detected in the deeper screen interval in probe VP-1, exceeds the applicable commercial ESL. However, TPHg and benzene concentrations in the soil vapor sample collected from the shallow screen interval in probe VP-1 do not exceed the applicable commercial ESL.

Site Cleanup Objectives

CAP cleanup objectives are based on one or more of the following criteria:

- ESLs established by the RWQCB's RBCA guidelines;
- Site Specific Target Levels established by conducting a Tier 2 RBCA evaluation;
- Current closure guidelines from the regulatory agencies, such as the California State Water Resources Control Board criteria for low-risk groundwater cases; or
- Application of Best Available Technology based on remediation system operation data that demonstrate asymptotic levels have been achieved for chemical concentrations in soil and/or groundwater.

Soil Clean-up Levels

For the purposes of this CAP, CRA assumes that the petroleum hydrocarbons detected in soil at the site may pose a risk to groundwater quality, human health, and/or the environment. Other than the Tier 1 RBCA evaluation, a detailed analysis of these potential risks has not yet been fully evaluated.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

Although significant reductions in soil concentrations of COCs can be attained by various remedial alternatives, attainment of the approved soil cleanup levels may prove to be technically or economically infeasible. Thus, soil cleanup is limited to that which is technically or economically feasible.

To establish soil cleanup levels, CRA proposes using the RWQCB ESLs as the soil clean-up levels for this site. As described above, unsaturated soil samples collected in the vicinity southeastern-most former dispenser island and the adjacent former product piping exceed respective ESLs.

Groundwater Clean-up Levels

According to the June 1999 *East Bay Plain Groundwater Basin Beneficial Use Evaluation Report for Alameda and Contra Costa Counties, CA*, groundwater in the area is an existing or probable drinking water resource, and the basin has depths ranging from 500 to over 1,000 feet. No drinking water wells have been identified in the vicinity of the site, and impacted groundwater beneath the site may be limited to the shallow water-bearing zone.

Per the Basin Plan, however, groundwater cleanup goals will be established based on the following:

- Background concentrations of individual pollutants;
- Applicable water-quality objectives maximum contaminant levels (MCLs) to protect designated beneficial uses of the water body for drinking water;
- Concentrations which do not pose a significant risk to human health or the environment; and
- Technologic and economic feasibility.

To establish groundwater cleanup levels, CRA proposes using the RWQCB ESLs as the clean-up levels for this site. As described above, petroleum hydrocarbon concentrations exceed applicable ESLs in groundwater beneath the site.

Remedial Alternatives Discussion and Approach

The proposed remediation objectives in this CAP are based on a combination of the above criteria. The CAP objectives are to implement the most cost-effective remedial approach to protect human health, groundwater quality and other sensitive receptors. Given the specific site conditions, the specific CAP objectives are to:

- Remove hydrocarbons from the identified source areas;
- Mitigate further hydrocarbon impact to groundwater;
- Reduce potential risks to current and future site occupants;
- Continue the groundwater monitoring program to monitor water quality; and

- Establish a contingency plan to expedite or enhance remediation if necessary.

Remediation alternatives reviewed in this CAP address these five objectives. Once hydrocarbons are substantially removed or hydrocarbon levels are reduced, natural attenuation processes may remediate any residual hydrocarbons and restore the impact area(s) to background concentrations.

CRA evaluated several remedial alternatives to achieve site remedial objectives. Remedial alternatives were selected to address the TPHg and BTEX components of fuel hydrocarbons. Past and recent subsurface investigation activities indicated that elevated levels of TPHg and BTEX are present in subsurface soils and groundwater. MTBE and oxygenate concentrations have been reported near or below laboratory detection limits. The remedial technologies selected for evaluation include monitored natural attenuation, in-situ chemical oxidation, dual-phase extraction, excavation, and air sparging. Each of these alternatives are discussed below and evaluated on the basis of technical feasibility and cost effectiveness.

Remedial Alternatives

Monitored Natural Attenuation (MNA)

MNA consists of allowing hydrocarbons to biodegrade naturally and implementing a long-term groundwater monitoring plan. Decreasing concentration trends are the primary indicators of natural attenuation of hydrocarbons in groundwater. Secondary indicators such as dissolved oxygen (DO) concentrations, oxidation-reduction potential, alkalinity, and nitrate, sulfate, and ferrous iron concentrations are also used to evaluate the existence of and the potential for natural attenuation.

Feasibility and Cost-Effectiveness: MNA is typically a low-cost alternative if cleanup levels can be met in a relatively short and/or acceptable timeframe. Given the current hydrocarbon concentrations in soil and groundwater, the timeframe to achieve cleanup levels by MNA is not reasonable.

Recommendation: CRA anticipates recommending MNA as a final remedial approach once active remediation is complete.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

In-Situ Chemical Oxidation (ISCO)

Injection of hydrogen peroxide can reduce hydrocarbon mass through in-situ chemical oxidation in two ways. In the presence of metals that are commonly found in the subsurface, the chemical reaction known as Fenton's Reagent produces a hydroxyl radical that is a strong oxidizer and ultimately oxidizes hydrocarbons to water and carbon dioxide. This reaction is strongly exothermic and results in increased soil and groundwater temperatures when used in-situ. Additionally, after introducing the solution into the subsurface, it also produces elevated dissolved oxygen concentrations in groundwater that can accelerate naturally occurring hydrocarbon biodegradation. The combination of chemical hydrocarbon oxidation within the treatment zone and enhanced biodegradation as dissolved oxygen migrates in groundwater away from the injection area can rapidly reduce hydrocarbon mass.

One method to apply hydrogen peroxide to a well would be to use a siphon pump and allow the hydrogen peroxide to infiltrate into the aquifer. Following the addition of the hydrogen peroxide, a slug of tap water would be added to the well to help facilitate hydrogen peroxide infiltration into the aquifer. The amount of hydrogen peroxide and tap water added to each well would be based on the well diameter, depth to groundwater, water temperature, and soil permeability. Multiple applications are usually required. "Sentry" wells would be monitored for dissolved oxygen (DO) prior to initiating hydrogen peroxide injection to obtain background values. Once hydrogen peroxide injection is initiated, DO levels are monitored routinely in the treatment wells and sentry wells. Monitoring of bioparameters and petroleum constituent concentrations is conducted to determine the effectiveness of the hydrogen peroxide treatment.

Another method to apply hydrogen peroxide to the subsurface would be to install temporary, direct-push probes to the desired depth intervals instead of using permanent groundwater monitoring wells. The hydrogen peroxide can be injected into the probes using a pump to provide maximum infiltration of the solution into the subsurface.

Feasibility and Cost-Effectiveness: CRA would utilize fixed injection point for implementation of hydrogen peroxide injection at the subject site since multiple injection events are preferred. Installation of 20 injection points (15 foot center spacing) and 3 observation wells are estimated to cost \$18,000. The existing monitoring wells would also be used as observation points. Each injection well would be injected with at least 15 gallons of a catalyst and 200 gallons of 10% H₂O₂ per event. CRA estimates up to five injection events. Each injection event is estimated to cost \$65,000. Five injection events is estimated to cost \$325,000.

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

Groundwater monitoring is estimated to cost approximately \$10,000 per year. Assuming 1.5 years of groundwater monitoring during hydrogen peroxide injection, and 3 years of groundwater monitoring following hydrogen peroxide injection to demonstrate that site cleanup goals will be met, the total cost for groundwater monitoring is \$45,000. The site closure request and well destructions would cost an estimated \$40,000. The total estimated cost for this alternative is \$428,000.

The effectiveness of hydrogen peroxide injection on impacted groundwater has been demonstrated in bench-scale studies and at various sites, but the reliability and costs remain uncertain when compared to other technologies, especially with impacted vadose zone soils. CRA is not confident that hydrogen peroxide could effectively be dispersed in impacted vadose zone soils near the former dispenser island. Finally, the addition of a liquid solution of hydrogen peroxide to soil may potentially cause leaching of hydrocarbons in soils to groundwater.

Recommendation: With the uncertainties regarding effectiveness and total overall cost, CRA does not recommend this remedial alternative.

Dual-Phase Extraction (DPE)

DPE is the process of applying high vacuum through an airtight well seal to simultaneously extract soil vapors from the vadose zone and groundwater from the saturated zone. The vacuum created by DPE can increase the groundwater yield from wells completed in low permeability formations. In addition, residual TPHg and BTEX in soil within the influence of the vacuum may be removed in the vapor phase. Groundwater extraction may provide hydraulic control of the hydrocarbon plume and reduce contaminant migration. Furthermore, extended dewatering of the saturated zone combined with vapor extraction can remediate residual hydrocarbons in the source area.

A positive displacement blower or liquid-ring pump may be used to create the higher vacuum needed to extract groundwater and soil vapors simultaneously. Alternatively, a submersible groundwater pump can be used to extract groundwater, while a blower or liquid-ring pump is used solely to extract soil vapors. The extraction device is supplemented with a soil vapor treatment (oxidizer or carbon adsorption) system. Extracted groundwater can be treated and discharged to the local sanitary sewer or storm drain with the appropriate authorization or off-hauled to a disposal facility.

Feasibility and Cost-Effectiveness: Pilot testing demonstrated that DPE is technically feasible, but would not necessarily be effective. Groundwater production and drawdown data suggested that significant dewatering (several extraction wells) would be required to sufficiently expose capillary fringe and saturated soils for vapor extraction.

Design, permitting, and installation of a DPE system is estimated to cost \$250,000, including the cost to install of four additional extraction wells. CRA estimates three years of operation, at an annual O&M cost of \$80,000, to reach the cost-effective limit of DPE. The annual O&M cost includes an estimated \$20,000 in sewer discharge fees. The total O&M cost equates to \$240,000. DPE system demo is estimated to cost \$30,000.

The groundwater monitoring cost for this site is estimated at \$11,000 annually and is anticipated to continue for 5 years after DPE operation. Therefore, the total groundwater monitoring cost is estimated at \$88,000. Well destructions and the closure request are estimated to cost \$35,000. The total projected cost for selecting DPE to remediate this site is estimated at \$643,000. These costs could increase in consideration of incorporating DPE with possible future development of the site

Recommendation: DPE costs at this site are high in order to maximize effectiveness. These higher costs can be attributed the higher groundwater extraction rate required for sufficient dewatering and the corresponding higher sewer disposal cost. Based on cost-effectiveness, CRA does not recommend this alternative.

Excavation

During excavation, contaminated soil is removed and transported to permitted off-site treatment and/or disposal facilities. In some cases, pre-treatment (via aeration, aboveground SVE, incineration, etc) of the contaminated media may be required in order to meet land disposal restrictions. Although excavation and off-site disposal alleviates the contaminant problem at the site, it does not treat the contaminant. The type of contaminant and its concentration level will impact off-site disposal requirements. The disposal of hazardous wastes is governed by the Resource Conservation and Recovery Act (RCRA) (40CFR Parts 261-265), and the U.S. Department of Transportation regulates the transport of hazardous materials (49 CFR Parts 172-179, 49 CFR Part 1387, and DOT-E 8876). Hazardous wastes must be treated to meet either RCRA or non-RCRA treatment standards prior to land disposal. Transport and disposal of non-hazardous or special wastes are regulated by applicable California regulations.

Standard earth moving equipment (backhoes, bobcats, loaders, etc.) is typically utilized for excavation. Depending on available space, this range of equipment can excavate to a depth of approximately 20 feet. Larger earth moving equipment (excavators) can excavate slightly deeper. Entry into excavations deeper than 5 feet requires shoring per OSHA regulations. Deep excavations may require shoring to prevent collapse of the sidewalls and to prevent damage or undermining of neighboring structures, utilities, sidewalks, etc. Additionally, dewatering of the excavated area may be required depending on the

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

groundwater elevation and recharge rates. The extent of excavation is typically estimated in advance using available soil boring data, but is ultimately directed by field personnel using field monitoring equipment such as a photo-ionization detector to screen soils by measurement of soil headspace vapor concentrations. Soil samples are collected for chemical analysis to confirm that the excavation limits are sufficient to meet soil cleanup levels.

Feasibility and Cost-Effectiveness: Based on historical soil analytical data, CRA has estimated a 50-foot by 50-foot area around the (former) eastern dispenser island. This excavation would extend to approximately 20 feet deep, which equates to 1,850 cubic yards (2,400 tons). Dewatering would not be required. Sidewall interlocking sheet pile shoring would be necessary. Implementation of this excavation is estimated to cost more than \$350,000. This estimate is based upon a 4-5 week period to complete excavation and restoration of the target area. The impacted soil is assumed to be non-hazardous waste. The cost includes engineering, permitting, monitoring well destruction and replacement, shoring, excavating, stockpiling, profiling the soil for disposal, confirmatory sampling and analyses, loading, off-hauling, disposal, backfilling and compaction, site restoration, and project management and reporting.

The parking lot would have to be closed during excavation activities, and the estimated costs of lost business were \$3,000 per week or \$15,000 total. Groundwater monitoring is estimated to cost approximately \$7,500 per year, and would likely be necessary for at least 5 years at this site following excavation (mostly for off-site/downgradient groundwater monitoring). The closure request and well destructions are estimated to cost \$25,000. The total cost for this alternative is estimated to be \$427,500.

Recommendation: Excavation would effectively remove source material in vadose zone soils. Capillary fringe and saturated soil impacts are at the depth limit of conventional excavation equipment. Deeper excavation would further increase the cost of this alternative. An acceptable decreasing hydrocarbon concentration trend in groundwater may not develop in a reasonable timeframe if these deeper impacts are left in place. Therefore, CRA does not recommend excavation to remediate this site. However, site development is likely to occur within the next few years. The necessity, benefits, and cost-effectiveness of excavation should be reconsidered if done concurrent with site development.

Air Sparging

Air Sparging (AS) is an in situ remedial technology that reduces concentrations of volatile constituents in petroleum products that are adsorbed to soils and dissolved in groundwater. This technology, which is also known as “in situ air stripping” and “in situ volatilization,” involves the injection of contaminant-

**CONESTOGA-ROVERS
& ASSOCIATES**

Mr. Jerry Wickham
February 25, 2008

free air into the subsurface saturated zone, enabling a phase transfer of hydrocarbons from a dissolved state to a vapor phase. The air is then vented through the unsaturated zone. Air sparging is most often used together with soil vapor extraction (SVE), but it can also be used with other remedial technologies. When air sparging is combined with SVE, the SVE system creates a negative pressure in the unsaturated zone through a series of extraction wells to control the vapor plume migration. This combined system is called SVE/AS. SVE has also been a common technology used for remediate vadose zone soils. The applied negative pressure moves air through and strips (via volatilization) hydrocarbons from vadose zone soils. Extracted soil vapors are typically abated using an oxidizer or granular activated carbon.

Feasibility and Cost-Effectiveness: CRA conducted an AS pilot test in date, which concluded that AS is technically feasible and efficient. The DPE pilot test also suggested that SVE is technically feasible for remediating vadose zone soils. Design and installation of an SVE/AS system would cost approximately \$145,000. This estimate is based on installation of 6 AS wells and 4 SVE wells. This would include reconstruction of well S-14 as a SVE wells. The cost of the system also includes underground piping and utilities, a remediation compound, and treatment system. The annual SVE/AS system operational cost is estimated at \$40,000. CRA assumes 1 to 3 years of AS/SVE operation, the total operational cost for 3 years would be \$120,000.

Annual groundwater monitoring is estimated at \$10,000. Assuming 3 years of groundwater monitoring during AS/SVE system operation, and 2 years of groundwater monitoring following SVE/AS to reach site cleanup goals, the total cost for groundwater monitoring is \$50,000. System demolition would cost approximately \$20,000, and the site closure request and well destructions would cost an estimated \$25,000. The total estimated cost for this alternative is \$360,000.

Recommendation: Given that pilot testing demonstrated the effectiveness of SVE/AS and it is one of the lower cost options, CRA recommends this remedial alternative.

Notes and Abbreviations:

mg/kg = Milligrams per kilogram

TPHg = Total petroleum hydrocarbons as gasoline by EPA Method 8015M or 8260B.

The following constituents analyzed by GCMS/8260B:

BTEX = Benzene, toluene, ethylbenzene, xylenes

MTBE = Methyl tertiary butyl ether

DIPE = Di-isopropyl ether

ETBE = Ethyl tertiary butyl ether

TAME = Tertiary amyl methyl ether

TBA = Tertiary butyl alcohol

1,2-DCA = 1,2-Dichloroethane

EDB = 1,2-Dibromoethane

NA = Not analyzed

<x = Not detected at or below reporting limits

a = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based on the specified standard.

* = Sample may have contained backfilled soil from air knife clearance activities.

Table 4: DPE Pilot Test - Vapor Phase Mass Removal - Former Shell Service Station, 461 8th Street, Oakland, CA

ACFM = Actual cubic feet per minute.

SCFM = Standard cubic feet per minute.

in WC = inches water column.

Atmospheric pressure = 406.86 in WC.

Absolute = Atmospheric pressure - gauge vacuum (in WC).

System flow rates and vacuum readings taken from two inch system header pipes.

Bold = Sample concentrations from Lab analysis; Non-Bold= field measured concentrations by a Horiba organic vapor analyzer.

TPHg analyzed by EPA Method 8015 VOC's analyzed by EPA Method 8260B from 1 liter teflar bag samples.

ACFM = SCFM(406.86+gauge pressure)/406

Removal/Emission Rate = C (ppmv) x Q (cfm) x (1lb-mole/386ft³) x MW (lb/lb-mole) x 60 min/hr x 24 hr/day x 10⁶

where; C = concentration, Q = flow, MW= molecular weight (86 lb/lb-mole for TPHg, 78 lb/lb-mole for benzene, 92 lb/lb-mole for Toluene, 106 lb/lb-mole for Ethylbenzene, and 106 lb/lb-mole for Xylene)

Cumulative removal = removal rate multiplied by the hour-interval of operation plus the previous total.

lbs = Pounds

ppmv = Parts per million by volume

ug/L = micrograms per liter

TPHg = Total petroleum hydrocarbons as gasoline

EW = Extraction Well

NM=no measurement

¹ Based on the steady-state radial pressure distribution equation from "A Practical Approach to the Design, Operation, and Monitoring of In Situ Soil Venting Systems",

P.C. Johnson, C.C. Stanley, M.W. Kembrowski, D.L. Byers, and J.D. Cothart, Groundwater Monitoring and Review, Spring 1990:

$$Ri = [Rw / [r/Rw]^{[(1-(Patm/Pw)^2)/(((P(r)/Pw)^2)-1)]}]$$

² Ratio of monitoring well gauge pressure to extraction well gauge pressure.

Rw = Radius of Extraction Well (feet)

r = Distance of monitoring well from extraction well (feet)

Pw = Absolute pressure applied at extraction well (inches of water column)

P(r) = Absolute pressure at monitoring well (inches of water column)

Ri = Radius of Influence (feet)

"H₂O = Inches of water"

ppmv = parts per million by volume

* Tedlar bag leaking upon arrival at lab

Attachment A
Site Background

ATTACHMENT A

Site Background

Former Shell Service Station
461 8th Street
Oakland, California

During January 1979, separate phase hydrocarbons (SPH) were reported in a Bay Area Rapid Transit (BART) tunnel under the intersection of 7th Street and Broadway. Product line testing at the site indicated a pressure leak, and the product lines were replaced in January 1979. The USTs were also tested for tightness and passed. According to the *Bart Recovery Project Log* (chronological list of events – 1/10/79 through 12/3/81) and a 1981 Groundwater Technology, Inc. *Considerations on Infiltration of Gasoline into BART KE Line* report, one observation well is reported to have been drilled to a depth of 25 feet concurrent with piping replacement with no reports of contamination. Separate-phase product samples taken from the BART tube in January 1979 and in May 1981 reported the product as Shell Regular. Approximately 2,600 gallons (48 55-gallon drums) of a gasoline-and-water mixture are reported to have been removed from the BART tunnel between October 1979 and April 1980. The Shell station discontinued operation in May 1980, and all existing improvements, tanks, and associated piping were removed at that time. It is unknown whether a UST and piping removal report exists; to date, it has not been located.

Seven monitoring wells (L-1 through L-7) were installed during 1981. Based on recommendations following this investigation, a recovery well was installed in the vicinity of well L-6 (now re-named S-6) in 1982. According to a September 14, 1993 GeoStrategies Inc. (GSI) *Work Plan*, groundwater extraction from the recovery well began in February 1982 and continued until August 1982, when the system was shut down because the effluent discharge exceeded permitted discharge levels. Wells L-1 through L-3 were destroyed during construction of the BART tunnels in the mid-1980's and are no longer accessible. Records of the well destructions are not available. Wells L-4, L-5, and L-6 were renamed S-4, S-5, and S-6. Gettler-Ryan Inc. began gauging wells S-4 through S-6 in 1986 and collecting groundwater samples for analysis in 1988. A November 2, 1993 *Work Plan for Soil and Groundwater Sampling* prepared by Enviros, Inc. (Enviros) indicates that groundwater was extracted from wells S-5 and S-6 by bailing or by a vacuum truck beginning in October 1988.

Information collected by GSI and reported in a June 30, 1993 *Phase I Preliminary Site Assessment* identified seven sites with known UST leaks within a ¼-mile radius of the site. One of the seven sites identified is the Oakland Police Department site, which was noted in the *Bart Recovery Project Log* to have replaced leaking USTs in October 1979 and to have accepted product deliveries by a local Shell gasoline distributor. During a review of available regulatory files, GSI noted a permit to repair the product lines and dispensers at the Oakland Police Department parking lot taken out in 1984 by Egan and Paradiso Company, but no additional information was available. It appears that no environmental investigation has been conducted for this site.

During July 1994, nine soil borings (B-1 through B-9) were installed in the vicinity of the former pump islands and the former USTs at the site. Investigation activities are described in an August 16, 1994 Enviro's *Site Investigation Report*. The maximum total petroleum hydrocarbons as gasoline (TPHg) and benzene concentrations reported in soil samples were 15 milligrams per kilogram (mg/Kg) and 0.24 mg/Kg, respectively, collected near the former pump islands. No TPHg or benzene was reported in the area of the former piping or the former UST locations.

During December 1994, onsite monitoring wells S-8, S-9, and S-10 were installed in similar locations as the previously destroyed wells L-2, L-3, and L-1, respectively. Investigation activities are described in a February 14, 1995 Enviro's *Site Investigation Report and Quarterly Monitoring Report – First Quarter 1995*. Except for 0.014 mg/Kg benzene in a sample from S-8 at 21.5 fbg, no TPHg or benzene was reported in soil samples collected from wells S-8 and S-9. Except for 760 mg/Kg TPHg and 0.0032 mg/Kg benzene reported in the sample from S-10 at 11.5 fbg, no TPHg or benzene was reported in soil samples collected from well S-10.

During October 2003, one soil boring (HA-1) was installed within 7th Street, south of the site. Three additional offsite soil borings (one in Broadway near well S-5, one northwest of Broadway within 6th Street, and one near the eastern corner of Broadway and 6th Street) were attempted. However, subsurface obstructions and utility corridors were encountered, and the borings could not be completed. No TPHg, benzene, or methyl tertiary butyl ether (MTBE) was detected in soil samples collected from boring HA-1. No TPHg or benzene, and 6.3 micrograms per liter ($\mu\text{g/L}$) MTBE were detected in a grab groundwater sample collected from boring HA-1. Investigation activities are described in the December 16, 2003 *Subsurface Investigation Report* prepared by Cambria Environmental Technology, Inc. (Cambria).

During May 2004, Treadwell & Rollo, Inc. (T&R) of Oakland, California installed four soil borings (TR-1 through TR-4) onsite to collect soil and soil vapor samples. No TPHg or volatile

organic compounds (VOCs) were detected in soil samples, and no benzene, toluene, ethylbenzene, or xylenes (BTEX) were detected in soil vapor samples collected. Investigation results are summarized in T&R's March 27, 2006 *Subsurface Investigation* report.

Access to the subject site for investigation activities had been limited by the previous property owner. Since the new owner anticipates construction a commercial development over the entire parcel, future access to the site for subsurface investigation will not be feasible. Thus, Cambria's June 7, 2006 *Subsurface Investigation Work Plan* provided the following activities and rationale for proposed work:

- The source of the impact in wells S-5 and S-6 has not been identified. The data obtained from the subject site to date does not support that the former Shell station is the source of impact to those wells; however, the lateral and vertical extent of shallow soil impact onsite has not been sufficiently assessed. Thus, Cambria recommends installing ten (10) soil borings (B-10 through B-19) in the vicinity of the former piping and dispenser areas.
- The lateral extent of shallow soil and groundwater impact along the property boundaries has not been sufficiently assessed. Thus, Cambria recommends installing four (4) soil borings (B-20 through B-23) for the collection of soil and grab groundwater samples.

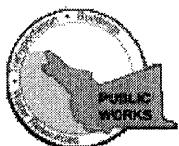

The Alameda County Environmental Health (ACEH) approved the work in correspondence dated August 29, 2006. The access agreement was executed In October 2006 and negotiations with the owner's tenant for access occurred in November 2006. The field work was then scheduled for early December 2006.

During December 2006, fourteen soil borings (B-10 through B-23) were drilled onsite. Impacted vadose zone soils were identified in B-12 and, to a lesser extent in B-13, B-14, and B-19. The grab groundwater samples from each boring (except B-20) indicated impact to groundwater beneath and downgradient (southwest) of the former dispenser islands. Investigation activities are described in the March 2, 2007 *Subsurface Investigation Report* prepared by Conestoga-Rovers & Associates (CRA).

Specific Work Permit Conditions

1. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.
2. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

Alameda County Public Works Agency - Water Resources Well Permit

3. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.
4. Compliance with the well-sealing specifications shall not exempt the well-sealing contractor from complying with appropriate State reporting-requirements related to well construction or destruction (Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code). Contractor must complete State DWR Form 188 and mail original to the Alameda County Public Works Agency, Water Resources Section, within 60 days. Including permit number and site map.
5. Applicant shall contact Vicky Hamlin for an inspection time at 510-670-5443 or email to vickyh@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.
6. Wells shall have a Christy box or similar structure with a locking cap or cover. Well(s) shall be kept locked at all times. Well(s) that become damaged by traffic or construction shall be repaired in a timely manner or destroyed immediately (through permit process). No well(s) shall be left in a manner to act as a conduit at any time.
7. Minimum surface seal thickness is two inches of cement grout placed by tremie
8. Minimum seal (Neat Cement seal) depth for monitoring wells is 5 feet below ground surface(BGS) or the maximum depth practicable or 20 feet.
9. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.
10. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

Borehole(s) for Investigation-Contamination Study - 4 Boreholes

Driller: Gregg Drilling - Lic #: 485165 - Method: DP

Work Total: \$200.00

Specifications

Permit Number	Issued Dt	Expire Dt	#	Hole Diam	Max Depth
Boreholes					
W2007-1119	11/05/2007	02/26/2008	4	2.00 in.	50.00 ft

Specific Work Permit Conditions

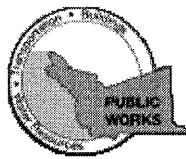

1. Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings. All cuttings remaining or unused shall be containerized and hauled off site. The containers shall be clearly labeled to the ownership of the container and labeled hazardous or non-hazardous.
2. Boreholes shall not be left open for a period of more than 24 hours. All boreholes left open more than 24 hours will

Alameda County Public Works Agency - Water Resources Well Permit

need approval from Alameda County Public Works Agency, Water Resources Section. All boreholes shall be backfilled according to permit destruction requirements and all concrete material and asphalt material shall be to Caltrans Spec or County/City Codes. No borehole(s) shall be left in a manner to act as a conduit at any time.

3. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.
 4. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County an Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.
 5. Applicant shall contact Vicky Hamlin for an inspection time at 510-670-5443 or email to vickyh@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.
 6. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.
 7. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.
 8. Permit is valid only for the purpose specified herein. No changes in construction procedures, as described on this permit application. Boreholes shall not be converted to monitoring wells, without a permit application process.

Boring Logs

Boring/Well Log Legend

KEY TO SYMBOLS/ABBREVIATIONS

▽	First encountered groundwater	PID =	Photo-ionization detector or organic vapor meter reading in parts per million (ppm)
▼	Static groundwater		
█	Soils logged by hand-auger or air-knife cuttings	fbg =	Feet below grade
〔〕	Soils logged by drill cuttings or disturbed sample	Blow Counts =	Number of blows required to drive a California-modified split-spoon sampler using a 140-pound hammer falling freely 30 inches, recorded per 6-inch interval of a total 18-inch sample interval
□	Undisturbed soil sample interval	(10YR 4/4) =	Soil color according to Munsell Soil Color Charts
■	Soil sample retained for submittal to analytical laboratory	msl =	Mean sea level
—	No recovery within interval		
====	Hydropunch or vapor sample screen interval		Soils logged according to the USCS.

UNIFIED SOILS CLASSIFICATION SYSTEM (USCS) SUMMARY

Major Divisions			Graphic	Group Symbol	Typical Description
Coarse-Grained Soils (>50% Sands and/or Gravels)	Gravel and Gravelly Soils	Clean Gravels (≤5% fines)		GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		Gravels with Fines (≥15% fines)		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
		Clean Sands (≤5% fines)		GM	Silty gravels, gravel-sand-silt mixtures
		Sands with Fines (≥15% fines)		GC	Clayey gravels, gravel-sand-clay mixtures
	Sand and Sandy Soils	Clean Sands (≤5% fines)		SW	Well-graded sands, gravelly sands, little or no fines
		Sands with Fines (≥15% fines)		SP	Poorly-graded sands, gravelly sand, little or no fines
		SM		Silty sands, sand-silt mixtures	
		SC		Clayey sands, sand-clay mixtures	
Fine-Grained Soils (>50% Silts and/or Clays)	Silts and Clays			ML	Inorganic silts, very fine sands, silty or clayey fine sands, clayey silts with slight plasticity
				CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
				OL	Organic silts and organic silty clays of low plasticity
	Silts and Clays			MH	Inorganic silts, micaceous or diatomaceous fine sand or silty soils
				CH	Inorganic clays of high plasticity
				OH	Organic clays of medium to high plasticity, organic silts
Highly Organic Soils				PT	Peat, humus, swamp soils with high organic contents

Subject: **Calscience Work Order No.: 07-12-1504**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/18/2007 and analyzed in accordance with the attached chain-of-custody.

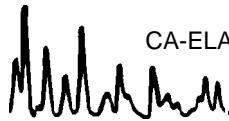

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

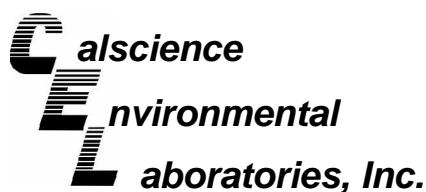

A handwritten signature in black ink that reads "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-1504

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 07-12-0959**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/12/2007 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-0959

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 07-12-0173**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/4/2007 and analyzed in accordance with the attached chain-of-custody.

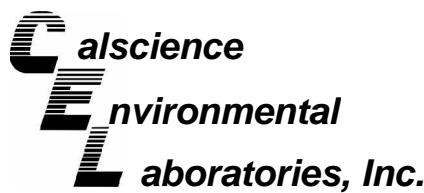

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-0173

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 07-12-1247**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/14/2007 and analyzed in accordance with the attached chain-of-custody.

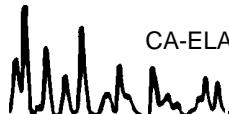

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that appears to read "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-1247

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

SAMPLE RECEIPT FORM

CLIENT: CLA

DATE: 12-14-07

TEMPERATURE – SAMPLES RECEIVED BY:**CALSCIENCE COURIER:**

- Chilled, cooler with temperature blank provided.
- Chilled, cooler without temperature blank.
- Chilled and placed in cooler with wet ice.
- Ambient and placed in cooler with wet ice.
- Ambient temperature.
- °C Temperature blank.

LABORATORY (Other than Calscience Courier):

- °C Temperature blank.
- °C IR thermometer.
- Ambient temperature.

Subject: **Calscience Work Order No.: 07-12-0983**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/12/2007 and analyzed in accordance with the attached chain-of-custody.

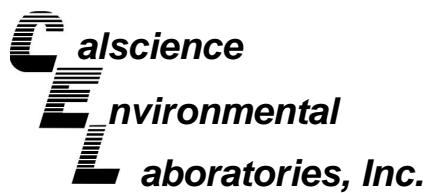

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-0983

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Cooler 1 of 1

SAMPLE RECEIPT FORM

CLIENT: CRA

DATE: 12/12/07

TEMPERATURE – SAMPLES RECEIVED BY:**CALSCIENCE COURIER:**

- Chilled, cooler with temperature blank provided.
- Chilled, cooler without temperature blank.
- Chilled and placed in cooler with wet ice.
- Ambient and placed in cooler with wet ice.
- Ambient temperature.

- °C Temperature blank.

LABORATORY (Other than Calscience Courier):

- 4-1 °C Temperature blank.
- °C IR thermometer.
- Ambient temperature.

Initial: JP

CUSTODY SEAL INTACT:

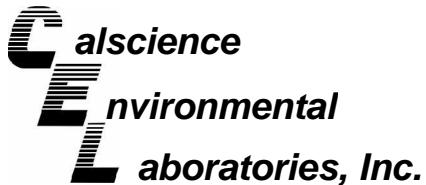

Sample(s): _____ Cooler: _____ No (Not Intact) : _____ Not Present:
 Initial: JP

SAMPLE CONDITION:

	Yes	No	N/A
Chain-Of-Custody document(s) received with samples.....	✓
Sampler's name indicated on COC.....	✓
Sample container label(s) consistent with custody papers.....	✓
Sample container(s) intact and good condition.....	✓
Correct containers and volume for analyses requested.....	✓
Proper preservation noted on sample label(s).....	✓
VOA vial(s) free of headspace.....	✓
Tedlar bag(s) free of condensation.....	✓

Initial: JP

Subject: **Calscience Work Order No.: 07-12-1505**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/18/2007 and analyzed in accordance with the attached chain-of-custody.

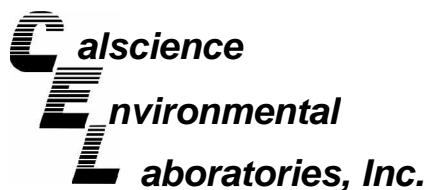

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Danielle Gonsman".

Calscience Environmental

Glossary of Terms and Qualifiers

Work Order Number: 07-12-1505

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 07-12-0171**
Client Reference: 461 8th Street, Oakland, CA

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 12/4/2007 and analyzed in accordance with the attached chain-of-custody.

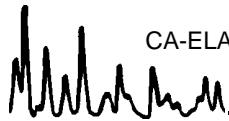

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

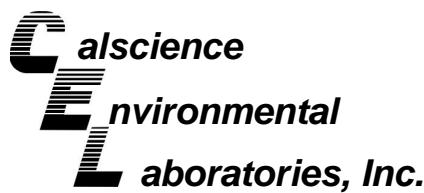

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Danielle Gonsman".

Glossary of Terms and Qualifiers

Work Order Number: 07-12-0171

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Certified Analytical Reports (Pilot Testing)

Report Number : 60462

Date : 1/10/2008

Dan Lescure
Conestoga-Rovers & Associates
5900 Hollis Street, Suite A
Emeryville, CA 94608

Subject : 5 Vapor Samples
Project Name : 461 8th St, Oakland
Project Number : 241501-010
P.O. Number : 97093399

Dear Mr. Lescure,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed.

Kiff Analytical is certified by the State of California (# 2236). If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink that reads "Joel Kiff".

Joel Kiff

Report Number : 60462

Date : 1/10/2008

Subject : 5 Vapor Samples
Project Name : 461 8th St, Oakland
Project Number : 241501-010
P.O. Number : 97093399

Case Narrative

The tedlar airbag labeled S15-A appeared to have a leak. This sample was analyzed as soon as possible after the leak was noticed

SHELL Chain Of Custody Record

60462

Report Number : 60486

Date : 1/11/2008

Dan Lescure
Conestoga-Rovers & Associates
5900 Hollis Street, Suite A
Emeryville, CA 94608

Subject : 4 Vapor Samples
Project Name : 461 8th St, Oakland
Project Number : 241501-010
P.O. Number : 97093399

Dear Mr. Lescure,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed.

Kiff Analytical is certified by the State of California (# 2236). If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink that reads "Joel Kiff".

Joel Kiff

Dear Mr. Lescure,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed.

Kiff Analytical is certified by the State of California (# 2236). If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink that reads "Joel Kiff".

Case Narrative

The reported value for TPH as Gasoline for sample S-15J exceeded the calibration range of the instrument and is flagged with a "J" to indicate that it is an estimate.

WELL CONCENTRATIONS
Former Shell Service Station
461 8th Street
Oakland, CA

Well ID	Date	TPPH (ug/L)	B (ug/L)	T (ug/L)	E (ug/L)	X (ug/L)	MTBE 8020 (ug/L)	MTBE 8260 (ug/L)	DIPE (ug/L)	ETBE (ug/L)	TAME (ug/L)	TBA (ug/L)	TOC (MSL)	Depth to Water (ft.)	GW Elevation (MSL)	SPH Thickness (ft.)
---------	------	----------------	-------------	-------------	-------------	-------------	------------------------	------------------------	----------------	----------------	----------------	---------------	--------------	----------------------------	--------------------------	---------------------------

Abbreviations:

TPPH = Total petroleum hydrocarbons as gasoline by EPA Method 8260B; prior to July 25, 2001, analyzed by EPA Method 8015.

BTEX = Benzene, toluene, ethylbenzene, xylenes by EPA Method 8260B; prior to July 25, 2001, analyzed by EPA Method 8020.

MTBE = Methyl tertiary butyl ether

ETBE = Ethyl tertiary butyl ether, analyzed by EPA Method 8260B.

DIPE = Di-isopropyl ether, analyzed by EPA Method 8260B.

TAME = Tertiary amyl methyl ether, analyzed by EPA Method 8260B.

TBA = Tertiary butyl alcohol, analyzed by EPA Method 8260B.

TOC = Top of Casing Elevation

TOB = Top of Wellbox Elevation

SPH = Separate-Phase Hydrocarbons

GW = Groundwater

ug/L = Parts per billion

MSL = Mean sea level

ft. = Feet

<n = Below detection limit

(D) = Duplicate sample

NA = Not applicable

WELL CONCENTRATIONS
Former Shell Service Station
461 8th Street
Oakland, CA

Well ID	Date	TPPH (ug/L)	B (ug/L)	T (ug/L)	E (ug/L)	X (ug/L)	MTBE 8020 (ug/L)	MTBE 8260 (ug/L)	DIPE (ug/L)	ETBE (ug/L)	TAME (ug/L)	TBA (ug/L)	TOC (MSL)	Depth to Water (ft.)	GW Elevation (MSL)	SPH Thickness (ft.)
---------	------	----------------	-------------	-------------	-------------	-------------	------------------------	------------------------	----------------	----------------	----------------	---------------	--------------	----------------------------	--------------------------	---------------------------

Notes:

a = Ethylbenzene and xylenes combined.

b = This sample analyzed outside of EPA recommended holding time.

c = Depth to water measured from Top of Casing; elevation unknown.

d = Grab sampled.

e = Casing broken; Top of Casing elevation unknown.

f = SPH detected at <0.01 feet.

g = S-6 was purged prior to sampling.

h = Analyzed by EPA Method 8015B (M).

i = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based upon the specified standard.

j = Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.

* = Prior to December 22, 1994, well elevations taken from Top of Casing.

Beginning July 18, 2002, well elevations taken from Top of Casing.

Site surveyed March 5, 2002 by Virgil Chavez Land Surveying of Vallejo, CA.
