Re: Semi-Annual Summary Report – Third Quarter 2009

76 Service Station No. 7376
4191 First Street
Pleasanton, California
RO# 0361

Dear Mr. Wickham:

On behalf of ConocoPhillips Company (ConocoPhillips), Delta Consultants (Delta) is submitting the subject report and forwarding a copy of TRC's *Quarterly Monitoring Report – July through September 2009*, dated October 1, 2009 for the above site.

Please contact the undersigned at (408) 826-1863 if you have questions.

Sincerely,

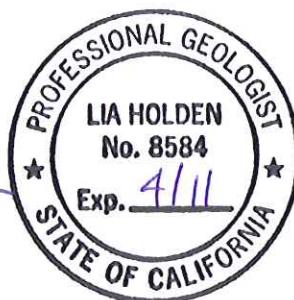

Delta Consultants

SEMI-ANNUAL SUMMARY REPORT Third Quarter 2009

INTRODUCTION

On September 1, 2009, TRC conducted quarterly groundwater monitoring and sampling at 76 Service Station No. 7376 (the site) on behalf of ConocoPhillips. The monitoring and sampling is conducted as part of site assessment and characterization activities.

SITE DESCRIPTION

The site is currently an active 76 Service Station located on the northern corner of First Street and Ray Street in Pleasanton, California (**Figure 1, TRC, Quarterly Monitoring Report**). Current site facilities consist of a cashier's kiosk, four product dispenser islands and two 12,000-gallon double-wall fiberglass gasoline underground storage tanks (USTs). There are currently 12 active groundwater-monitoring wells at and in the site vicinity (**Figure 2, TRC**). The site is bounded northwest by a former Southern Pacific Railroad right-of-way currently owned by Alameda County, north and northeast by a commercial building, southeast by First Street, and southwest by Ray Street. There is an underground KinderMorgan petroleum pipeline presently located in the Alameda County property adjacent to the northwest edge of the site. Properties in the immediate site vicinity are used for a mix of residential and commercial purposes. A Shell service station is located east of the site. The site is located at an approximate elevation of 366 feet above mean sea level.

GEOLOGY AND HYDROGEOLOGY

The following sections are taken from Delta's Site Conceptual Model Report dated September 30, 2009.

The subject site is located near the southwest end of the Livermore Valley. The site is situated on a northern facing hill, and slopes slightly to the north. The Arroyo Valley stream is located approximately 1,100 feet to the north of the site. The site is underlain by Holocene age alluvial fan deposits, described by the Department of Water Resources (DWR) in Bulletin 118-3 as "unconsolidated, moderately sorted, permeable fine sand and silt, with gravel becoming more abundant toward fan heads with canyons." The site is approximately three miles east of the northwest trending Pleasanton Fault (USGS 2006). Holocene alluvial fan deposits under the site are underlain by the Livermore Formation, consisting of northward dipping sand and gravel deposits.

The site is located within the Amador Sub-basin of the Livermore Valley Groundwater Basin. Groundwater in the Amador sub-basin occurs in both unconfined and confined conditions. In the shallower, unconfined aquifers, groundwater is first encountered generally about 30 to 50 feet bgs. Deeper aquifers are encountered within sand and gravel deposits at a depth of approximately 90 to 100 feet bgs (DWR, 2003). A Zone 7 water district contour map shows groundwater flow in both confined and unconfined aquifers toward the gravel pits in the center of the sub-basin north of the site. A contour map from the Zone 7 Well Master Plan shows a flow within the "deeper aquifer" to the west. Sand and gravel pit groundwater extraction areas are located greater than one mile north of the site in the central portion of the sub-basin. The site appears to be outside the area of influence of any groundwater extraction wells.

The City of Pleasanton is served by the Zone 7 Water Agency. Based on information provided by personnel from the Zone 7 Water Agency, the City of Pleasanton obtains 80% of its water from the Hetch-Hetchy reservoir, the San Joaquin/Sacramento Delta and multiple deep-water wells

located in the Fremont area. The remaining water is pumped from wells in Pleasanton that range in depth from 50-600 feet bgs (ACWD 1993-2006).

The site is underlain by complexly interlayered clay (Unified Soil Classification CL), silt (ML), silty sand (SM), clayey sand (SC), silty gravel (GM), sand (SP, SW), and gravel (GW). Contacts between soil types are often gradational. All soils contain various percentages of silt and sand. Soils have been combined into two units; generally fine grained, moderate to low permeability soils (clay, silt, with some clayey sand and clayey gravel) and generally coarse-grained, moderate to high permeable soils (sand, gravel, with some interlayered silt, silty sand, and silty gravel).

Soil layers appear to dip to the north-northeast at an angle of approximately 15 degrees. Groundwater was first encountered in borings drilled between 1996 and 1998 typically at a depths of approximately 65 to 75 feet below ground surface (bgs) (KEI 1996), (GR 1999). Perched groundwater was encountered in thin permeable sand and gravel beds at depths as shallow as 40 feet bgs. Saturated layers are separated by low permeability dipping clay and silt beds. Saturated beds appear to be confined or semi-confined.

As described and illustrated in Delta's Site Conceptual Model dated September 30, 2009, two saturated permeable layers are recognized and are designated A and B. Wells MW-5, MW-7, MW-8, and MW-9, appear to be screened across the upper of the two layers (A). Wells MW-1 (destroyed), MW-2B (destroyed), MW-1B, MW-2C, MW-3B, MW-6, and MW-10 appear to be screened in the lower of the units (B). Well MW-4 appears to be screened below the lowest of the two units (B). Depth to groundwater in wells MW-4 through MW-10 on June 22, 2009, ranged from 57.43 (MW-7) to 70.45 (MW-6) feet below top of casing. Groundwater flow was to the east. Groundwater levels in wells have risen by approximately 15 feet since late-2005 (see chart below). Seasonal fluctuations may be as great as 10 feet.

SITE BACKGROUND AND ACTIVITY

The site was developed in 1899 as a warehouse to store grains and hay. According to a Sanborn map, an "in-ground" storage tank for oil was installed onsite in 1907. A service station was first constructed on the site in 1976. Between November 8, 1982 and February 8, 1985, the Pleasanton Fire Department (PFD) responded to five separate fuel releases at the site. The releases occurred prior to acquisition of the property by Unocal Corporation in 1988, and prior to ConocoPhillips assuming operations at the site.

June 1987: Three exploratory soil borings were advanced to depths ranging from 46.5 to 55 feet bgs. Soil samples contained low to moderate maximum concentrations of petroleum hydrocarbons. Groundwater was not encountered.

August 1987: One soil boring was advanced to a depth of 66.5 feet bgs. Low to moderate concentrations of petroleum hydrocarbons were detected in a soil sample collected at 35 feet bgs. Groundwater was not encountered.

December 1987: Three monitoring wells were installed to depths of 96.5 feet bgs. Maximum petroleum hydrocarbon concentrations in soil samples generally declined with increasing depth.

December 1987: Four 12,000-gallon underground storage tanks (USTs) were replaced with two 12,000-gallon double-walled USTs. An unknown volume of hydrocarbon-impacted soil was removed and transported to a Class I facility.

September 1994: A dispenser and product piping upgrade was conducted with confirmation sampling. Over-excavation was conducted in the area of two soil samples with elevated hydrocarbon concentrations.

February 1995: Monitoring well MW-2 was destroyed because asphalt tar had entered the well during repaving. The well was replaced by MW-2B. Soil boring EB-1 was advanced to a total depth of 66 feet bgs. Twenty-nine soil samples were collected during drilling and submitted for analysis.

July 1996: Three monitoring wells were installed to depths of 73.5 to 93 feet bgs. Two wells were installed offsite, in the former Southern Pacific Railroad right-of-way. A total of forty seven soil samples were collected from the well borings and analyzed for total petroleum hydrocarbons as gasoline (TPH-G) and benzene, toluene, ethyl benzene and xylenes (BTEX). Fuel fingerprinting was also conducted. Petroleum hydrocarbon concentrations in the range of total petroleum hydrocarbons as diesel (TPH-D), kerosene, motor oil, and unidentified extractable hydrocarbons were also identified in the samples.

June 1997: Separate phase hydrocarbons (SPH) were identified in well MW-5 during quarterly monitoring activities.

December 1997: Entrix Inc. conducted a forensic geochemical analysis on SPH extracted from well MW-5. The SPH was probably composed of a mixture of over 50% refined gasoline and heavier hydrocarbons. The gasoline constituents appeared to be relatively fresh. The heavier hydrocarbon mixture had a carbon distribution ranging from about C13 to C33. This distribution is similar in nature to a very weathered crude oil or Bunker C fuel, not refined petroleum products such as diesel #2, motor oil, lube oil, etc.

June/August 1998: Five onsite soil borings were advanced and two offsite downgradient monitoring wells were installed. A total of forty soil samples were collected and analyzed for petroleum hydrocarbons. In addition, two soil samples containing visible SPH were collected from boring B-11 (onsite near the former UST excavation) at 10.5 and 61 feet bgs and submitted for hydrocarbon fingerprinting. The results of these analyses showed that the SPH from both samples was composed of approximately 90% highly to severely weathered semi-volatile and high boiling components identified as crude oil and 10% of slightly weathered gasoline.

October-November 2000: GR advanced one offsite soil boring (B-13) and advanced and installed two offsite groundwater monitoring wells (MW-9, MW-10). A total of twenty eight soil samples were collected from the soil and well borings and analyzed for TPH-G, BTEX, and methyl tertiary butyl ether (MTBE). Soil samples collected from well boring MW-9 between 16 and 60.5 feet and boring B-13 between 85.5 and 126 feet bgs were reported as non-detect for all analytes. Some soil samples collected from well boring MW-10 contained TPH-G, benzene, unidentified hydrocarbons with a carbon range of C6 to C12, and MTBE. Nine soil samples collected from boring B-13 between 7.5 and 73.5 feet bgs contained TPH-G, unidentified hydrocarbons with a carbon range of greater than C10, benzene, and MTBE. Grab groundwater samples were collected from each of the borings. Groundwater samples collected at 128.5 and 133 feet bgs from boring B-13 contained 150 and 620 ppb TPH-G, 17 and 53 ppb benzene, and 3.5 and 3.7 ppb MTBE, respectively. Groundwater sample G-1, collected from well boring MW-9 at 55 feet bgs, contained 66 ppb MTBE. The groundwater sample collected at 90 feet bgs from well boring MW-10 contained 34 ppb MTBE. The groundwater sample collected at 95 feet bgs from well boring MW-10 contained 230 ppb TPH-G and 54 ppb MTBE.

September 2001: Two offsite soil borings were drilled by GR and completed as groundwater monitoring wells MW-11 and MW-12. The wells were installed to total depths of approximately 86 and 88 feet bgs, respectively. Soil samples were reported as non-detect for all analytes. A grab

groundwater sample collected from a perched groundwater zone at 40 feet bgs in well boring MW-12 was reported as non-detect for TPH-G, BTEX, and MTBE.

October 2003: Site environmental consulting responsibilities were transferred to TRC.

October 2007: Site environmental consulting responsibilities were transferred to Delta.

February 2008: Seven CPT borings (CPT-1 through CPT-7) were advanced by Gregg Drilling and Testing under the oversight of Delta Consultants. Two boring locations (CPT-1 and CPT-2) were onsite. The other five boring locations (CPT-3 through CPT-7) were offsite. TPPH was detected in four groundwater samples with a maximum concentration of 1,500 micrograms per liter. TPH-D was detected in five groundwater samples with a maximum concentration of 660 micrograms per liter.

June 2009: Delta oversaw the abandonment of wells MW-1, MW-2B, and MW-3, and replaced the wells as MW-1A, MW-2C, and MW-3A. Soil samples were collected for laboratory analysis from the boring for well MW-2C. TPH-G was detected in soil at a maximum concentration of 1,400 mg/kg at 20 feet.

September 9, 2009: Delta oversaw the re-surveying of all monitoring wells associated with the site.

SENSITIVE RECEPTORS

Well surveys were performed in 2004 by Toxicem Management Systems, Inc and in 2005 by Delta. The 2004 survey identified 18 wells within a ½-mile radius. No field verifications were made during this survey. The surveys were performed on behalf of a Shell branded service station located at 4221 First Street, across first street from the site. Delta's 2005 survey identified a total of 14 wells within a one-mile radius. These well locations were field verified. The following excerpt is contained in Delta's *Site Conceptual Model* dated February 6, 2006:

Well Survey – In May 2004, Toxicem Management Systems, Inc. (Toxicem) obtain information from the Zone 7 Water District (Zone 7) and the DWR. A copy of Toxicem's well survey map and summary table are attached. The nearest wells identified were a well of "unknown" use (3S/1E-21B) and a municipal well (3S/1E-21B1) both located approximately 900 feet northeast of the site. Toxicem was unable to locate either well in the field and concluded that they were likely abandoned. In November 2005, Delta observed an old water tower building near the location of the two wells. A municipal well (3S/1E-16P1) was identified to be located >1,200 feet north of the site. Again, Toxicem could not field locate the well.

In September 2005, Delta performed an additional well survey for the site area. A well location map was obtained from Zone 7. The map identified three wells approximately 1,000 feet northwest of the site (3S/1E-21C1, -21C3, and -21C4.) Well -21C1 was classified as a "supply well", -21C3 as "abandoned or unlocatable", and -21C4 as "other designated well." Delta was only able to field located Well -21C4. The well provides irrigation water for a small city park. Delta also located a similar well in Kottinger Park located approximately 800 feet east of the site.

MONITORING AND SAMPLING

Groundwater samples were collected on September 1, 2009 and analyzed for TPH-G by GC/MS; BTEX and MTBE by US Environmental Protection Agency (EPA) Method 8260B. Current and historic groundwater monitoring data is included in TRC report *Quarterly Monitoring Report, July*

through September 2009 dated October 1, 2009. The report also contains maps illustrating the distribution of petroleum hydrocarbons in groundwater.

There are currently 4 onsite and 8 offsite monitoring wells included in the sites quarterly monitoring and sampling program. Wells MW-1B, MW-2C, MW-3B and MW-5 are sampled quarterly and wells MW-4, MW-6 through MW-12 are sampled semi-annually during the second and fourth quarters. On September 1st, 2009 all wells were gauged. Only wells MW-1B and MW-5 were sampled, as MW-2C and MW-3B were dry. Groundwater was measured between 67.51 (MW-12) and 87.60 (MW-6) feet below TOC. Groundwater flow was reported north and southeast at gradients of 0.04 feet per foot (ft/ft) and 0.15 ft/ft, respectively. This is inconsistent with a gradient of 0.06 ft/ft east during the previous sampling event of June 22, 2009

Dissolved groundwater concentrations are reported as follows.

TPH-G was detected in both of the sampled wells with a maximum concentration of 49,000 micrograms per liter ($\mu\text{g}/\text{L}$) in well MW-5. This is an increase from the concentration of 16,000 micrograms per liter ($\mu\text{g}/\text{L}$) in this well during the previous sampling event. TPH-G was also reported in newly installed well MW-1B at a concentration of 230 ($\mu\text{g}/\text{L}$).

MTBE was detected in both of the sampled wells with a maximum concentration of 2,500 $\mu\text{g}/\text{L}$ in well MW-5. This is a decrease from 5,000 $\mu\text{g}/\text{L}$ in well MW-5 reported during the previous sampling event. MTBE was reported in newly installed well MW-1B at a concentration of 220 $\mu\text{g}/\text{L}$.

Benzene was detected well MW-5 at a concentration of 1,900 $\mu\text{g}/\text{L}$. This is a decrease from the previous sampling event, during which benzene was reported at 2,700 $\mu\text{g}/\text{L}$. Benzene was not reported above the laboratory reporting limit in MW-1B.

Toluene was detected in MW-5 with a concentration of 78 $\mu\text{g}/\text{L}$ in MW-5 during the current sampling event. This is consistent with the concentration reported in the previous quarter of 75 $\mu\text{g}/\text{L}$. Toluene was not reported above the laboratory reporting limit in MW-1B.

Ethylbenzene was detected MW-5 with a concentration of 1,400 $\mu\text{g}/\text{L}$ in MW-5 during the current sampling event. This is an increase from the previous sampling event, during which ethylbenzene was reported at 630. Ethylbenzene was not reported above the laboratory reporting limit in MW-1B.

Total Xylenes was detected in MW-5 with a concentration of 260 $\mu\text{g}/\text{L}$ during the current sampling event. This is an increase from a concentration of 160 $\mu\text{g}/\text{L}$ in this well during the previous sampling event. Total Xylenes was not reported above the laboratory reporting limit in MW-1B.

TPH-D was only analyzed in well MW-1B. Groundwater from MW-5 was not analyzed for TPH-D, since the well went dry before a sample could be collected. TPH-D was not reported above the laboratory reporting limit in MW-1B.

TBA was only analyzed in well MW-1B, and was reported at a concentration of 49 $\mu\text{g}/\text{L}$.

Fuel Finger Printing was not performed in either MW-1B or MW-5, due to the wells going dry during purging.

Remediation Status

Remediation is not currently being conducted at the site. Bi-monthly liquid-phase hydrocarbon (LPH) gauging and recovery from well MW-5 were implemented in the Second Quarter 2006. During 2006, approximately 0.14 gallons of LPH were recovered from MW-5. No LPH has been reported in MW-5 since December 2006.

Site Characterization

Multiple releases of gasoline from the site USTs, dispenser islands and product piping occurred between 1982 and 1994 when spills and leaks were reported during annual inspections and tank refilling. A report documenting the removal of the site USTs in 1987 is unavailable, hence it is uncertain if the former USTs were a source of contamination. Results of fuel fingerprinting analyses indicate that a heavy hydrocarbon source exists or existed at the site. This source is most likely the former Bunker C fuel tank which previously resided on Alameda County property northwest of the site.

Soil contamination has consistently been encountered at the site in the vicinity of the fuel USTs and product lines, primarily in northern portion of the site, and off-site to the north. Soil contamination has been reported from 3 feet bgs to approximately 70 feet bgs.

TPH-G, BTEX and MTBE concentrations in groundwater samples from wells MW-1, MW-3, MW-7, MW-10 and MW-11 continue to decline. Concentrations in wells MW-2B, MW-5, MW-6 and MW-9 appear to be stable. Concentrations in MW-8 appear to be on an increasing trend.

The on-site assessment is deemed complete. The petroleum hydrocarbon source area in the northern portion of the site has been defined by three borings (B-10 through B-12), three groundwater monitoring wells (MW-1B, MW-2C, and MW-3B), and CPT boring CP-1. The southern portion of the site has been explored by three soil borings (B-8, B-9, and EB-1), monitoring well MW-4, and CPT boring CP-2. Elevated petroleum hydrocarbons were detected in soil samples from boring EB-1 but not in groundwater from adjacent well MW-4.

The upgradient (southern) extent of the dissolved petroleum hydrocarbon and fuel oxygenate plume is defined by data from Shell CPT-2. The off-site heavy fuel source (bunker fuel tank) has been defined by borings SB-1 and B-13. The northern portion of the plume is defined by wells MW-7 and MW-9. Petroleum hydrocarbon and MTBE concentrations are rising in downgradient well MW-8 located near the leading edge of the plume. TPH-G, MTBE, and TBA were detected in nearby CPT boring CP-6 at 160 ug/l, 110 ug/l, and 170 ug/l, respectively. TPH-G, MTBE, and TBA were detected in CPT boring CP-7, located approximately 60 feet to the northwest of MW-8, at 200 ug/l, 260 ug/l, and 120 ug/l, respectively. Delta recommends installation of a groundwater monitoring well in the vicinity of CPT boring CP-7 to define the extent the plume to the northwest.

Delta recommends that the County of Alameda further investigate the presence of heavy metals detected in surface soils within the former railway right-of-way. Arsenic and lead were found at elevated concentrations in soil samples collected during a study of the Alameda County Transportation Corridor in 2007. The service station is not considered to be a source of the heavy metals detected in surficial soils in the transportation corridor. Additionally, it is recommended that the County confirm the presence or absence of the former bunker fuel UST.

Feasibility Testing

Delta proposes to prepare a work plan for a remediation Feasibility Study (FS). Testing is anticipated to focus on the area of the site USTs and off-site well MW-5. Tests will be used to define soil parameters critical in the selection and design of a remediation system. Tests could include a aquifer pumping test, soil vapor extraction test, and air injection test. Tests will be described in a report along with results and submitted to ACEH for review.

Corrective Action Plan

Upon completion of the FS, Delta will prepare a Corrective Action (CAP). The CAP will propose soil and groundwater cleanup levels based on site conditions and land use considerations. The CAP will evaluate a minimum of three remediation alternatives in terms of regulatory acceptance, technical feasibility, time requirement for completion, and cost for implementation and annual operation and maintenance. A remediation approach will be selected along with development of a contingency plan in the event that the primary approach is not effective.

RECENT CORRESPONDENCE

In a letter dated July 23, 2009, the Alameda County Department of Environmental Health stated that all site wells with the exception of MW-1B, MW-2C, MW-3B and MW-5 would be monitored and sampled semi-annually during the second and fourth quarters.

September 30, 2009, Delta submitted a Site Conceptual Model, which proposed an additional monitoring well in the vicinity of CPT-7. Delta also recommended that Alameda County further assess the concentrations of metals reported in the railroad corridor bounding the northeast portion of the site during the January 2008 BSK investigation.

THIS QUARTER ACTIVITIES (Third Quarter 2009)

- Monitoring and sampling of the groundwater monitoring well network was conducted by TRC on September 1, 2009
- TRC Prepared *Quarterly Monitoring Report July through September 2009*, dated October 1, 2009
- Delta prepared and submitted a Site Conceptual Model Dated September 30, 2009.

NEXT QUARTER ACTIVITIES (Fourth Quarter 2009)

- TRC will conduct the fourth quarter 2009 groundwater monitoring and sampling event and will prepare a quarterly monitoring report.
- Delta prepared and submitted the Third Quarter Quarterly Summary Report.

Summary Sheet	Summary of Gauging and Sampling Activities
Tables	Table Key Contents of Tables Table 1: Current Fluid Levels and Selected Analytical Results Table 1a: Additional Current Analytical Results Table 2: Historic Fluid Levels and Selected Analytical Results Table 2a: Additional Historic Analytical Results Table 3: Liquid Phase Hydrocarbon Recovery Data
Figures	Figure 1: Vicinity Map Figure 2: Groundwater Elevation Contour Map Figure 3: Dissolved-Phase TPH-G (GC/MS) Concentration Map Figure 4: Dissolved-Phase Benzene Concentration Map Figure 5: Dissolved-Phase MTBE Concentration Map
Graphs	Groundwater Elevations vs. Time TPH-G Concentrations vs. Time Benzene Concentrations vs. Time MTBE Concentrations vs. Time
Field Activities	General Field Procedures Field Monitoring Data Sheets – 09/01/09 Groundwater Sampling Field Notes – 09/01/09 Statement of Non-Completion – 09/01/09 Field Monitoring Data Sheets – 07/07, 07/27, 08/03, 08/19, and 09/22/09
Laboratory Reports	Official Laboratory Reports Quality Control Reports Chain of Custody Records
Disposal Documents	Disposal/Treatment Manifests – Current (Pending)
Statements	Limitations

Summary of Gauging and Sampling Activities
July 2009 through September 2009
76 Station 7376
4191 First Street
Pleasanton, CA

Project Coordinator: **Terry Grayson**
Telephone: **916-558-7666** Water Sampling Contractor: **TRC**
Compiled by: **Christina Carrillo**

Date(s) of Gauging/Sampling Event: **09/01/09**

Sample Points

Groundwater wells: **4** onsite, **8** offsite Points gauged: **12** Points sampled: **2**
Purging method: **Bailer**
Purge water disposal: **Crosby and Overton treatment facility**
Other Sample Points: **0** Type: --

Liquid Phase Hydrocarbons (LPH)

Sample Points with LPH: **0** Maximum thickness (feet): --
LPH removal frequency: -- Method: --
Treatment or disposal of water/LPH: --

Hydrogeologic Parameters

Depth to groundwater (below TOC): Minimum: **67.51 feet** Maximum: **87.6 feet**
Average groundwater elevation (relative to available local datum): **288.64 feet**
Average change in groundwater elevation since previous event: **-8.76 feet**
Interpreted groundwater gradient and flow direction:
Current event: **0.04 north to 0.15 southeast**
Previous event: **0.05 ft/ft, east (06/22/09)**

Selected Laboratory Results

Sample Points with detected **Benzene**: **1** Sample Points above MCL (1.0 µg/l): **1**
Maximum reported benzene concentration: **1,900 µg/l (MW-5)**

Sample Points with **TPH-G by GC/MS** **2** Maximum: **49,000 µg/l (MW-5)**
Sample Points with **MTBE 8260B** **2** Maximum: **2,500 µg/l (MW-5)**

Notes:

MW-10=Sampled Q2 and Q4 only, MW-11=Sampled Q2 and Q4 only, MW-12=Sampled Q2 and Q4 only, MW-2C=Dry, MW-3B=Dry, MW-4=Sampled Q2 and Q4 only, MW-6=Sampled Q2 and Q4 only, MW-7=Sampled Q2 and Q4 only, MW-8=Sampled Q2 and Q4 only, MW-9=Sampled Q2 and Q4 only

TABLES

TABLE KEY

STANDARD ABBREVIATIONS

--	= not analyzed, measured, or collected
LPH	= liquid-phase hydrocarbons
Trace	= less than 0.01 foot of LPH in well
ug/l	= micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	= milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	= not detected at or above laboratory detection limit
TOC	= top of casing (surveyed reference elevation)
D	= duplicate
P	= no-purge sample

ANALYTES

BTEX	= benzene, toluene, ethylbenzene, and (total) xylenes
DIPE	= di-isopropyl ether
ETBE	= ethyl tertiary butyl ether
MTBE	= methyl tertiary butyl ether
PCB	= polychlorinated biphenyls
PCE	= tetrachloroethene
TBA	= tertiary butyl alcohol
TCA	= trichloroethane
TCE	= trichloroethylene
TPH-G	= total petroleum hydrocarbons with gasoline distinction
TPH-G (GC/MS)	= total petroleum hydrocarbons with gasoline distinction utilizing EPA Method 8260B
TPH-D	= total petroleum hydrocarbons with diesel distinction
TRPH	= total recoverable petroleum hydrocarbons
TAME	= tertiary amyl methyl ether
1,1-DCA	= 1,1-dichloroethane
1,2-DCA	= 1,2-dichloroethane (same as EDC, ethylene dichloride)
1,1-DCE	= 1,1-dichloroethene
1,2-DCE	= 1,2-dichloroethene (cis- and trans-)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation – Measured Depth to Water + (D_p x LPH Thickness), where D_p is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A “J” flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.

REFERENCE

TRC began groundwater monitoring and sampling for 76 Station 7376 in October 2003. Historical data compiled prior to that time were provided by Gettler-Ryan Inc.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurements are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, sample time, and the sampler's initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging and Sampling

The sequence in which monitoring activities are conducted is specified on the TSR. In general, wells are gauged beginning with the least affected well and ending with the well that has the highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected to the most-affected well.

Decontamination

In order to reduce the possibility of cross contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging, and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

Total Petroleum Hydrocarbons

Quality Control Report - Laboratory Control Sample

Constituent	Batch ID	QC Sample ID	QC Type	Result	Spike Level	PQL	Units	Control Limits				
								Percent Recovery	RPD	Percent Recovery	RPD	Lab Quals
Diesel Range Organics (C12 - C24)	BSI0759	BSI0759-BS1	LCS	387.96	500.00	50	ug/L	77.6		48 - 125		
Tetracosane (Surrogate)	BSI0759	BSI0759-BS1	LCS	18.044	20.000		ug/L	90.2		28 - 139		

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A90	TPPH does not exhibit a "gasoline" pattern. TPPH is entirely due to MTBE.
Z1	Combined two VOAs for a complete sample.
