Report No. 140107.04

INTRODUCTION

This report summarizes field activities performed by Gettler-Ryan Inc. (GR) from October 7 through December 6, 1999, at the subject site. The purpose of this subsurface investigation was to collect data to better understand the local geology/hydrogeology and to delineate the lateral and vertical extent of hydrocarbon-impacted soil and groundwater adjacent to the subject site. The work performed included: drilling three off-site soil borings and constructing groundwater monitoring wells in two of the borings; collecting soil samples for description and chemical analysis; developing and sampling the newly installed groundwater monitoring wells; surveying all of the wells and borings; analyzing the soil and groundwater samples; and preparing this report. In addition, two soil samples were collected for Risk Based Corrective Action (RBCA) evaluation analysis. This work was performed at the request of Tosco Marketing Company (Tosco) and in response to a meeting of Alameda County Health Care Services Agency (ACHCSA), Regional Water Quality Control Board (RWQCB), Tosco, and GR personnel on April 20, 1999. This work was proposed in the GR Report No. 140107.04-1, *Work Plan for a Subsurface Investigation*, dated May 28, 1999. The Work Plan was approved with conditions in a letter from the ACHCSA dated August 13, 1999.

SITE DESCRIPTION

The subject site is an operating service station located on the north corner of the intersection of First Street and Ray Street in Pleasanton, California (Figure 1). The site is bounded to the northwest by a former Southern Pacific Railroad right-of-way currently owned by Alameda County, to the north and northeast by a commercial building, to the southeast by First Street, and to the southwest by Ray Street. Properties in the immediate site vicinity are used for a mix of residential and commercial purposes that include restaurants and shopping facilities. The site is located at an approximate elevation of 366 feet above sea level. Current site facilities consist of a kiosk with four product dispenser islands and two 12,000-gallon double-wall fiberglass gasoline underground storage tanks (USTs). Locations of the pertinent site features are shown on the Site Plan (Figure 2).

SITE HISTORY/PREVIOUS ENVIRONMENTAL WORK

Below is a summary of data presented in a meeting between RWQCB, ACHSCA, Tosco and GR personnel on April 20, 1999. Historical analytical data are included in Appendix A.

The site was developed in 1899 as a warehouse to store grains and hay (Amador-Livermore Valley Historical Society, 1994). According to a Sanborn map, an "in-ground" storage tank for oil was installed on-site in 1907. The first service station was built on the site in 1976 (Enviros, 1995). Between November 8, 1982 and February 8, 1985, the Pleasanton Fire Department (PFD) responded to five separate fuel releases at the site (PFD, 1988).

On June 30, 1987, exploratory soil borings B-1, B-2, and B-3 were drilled at the site and sampled by Applied GeoSystems (AGS). Borings B-1 and B-2 were drilled to a final depth of 46.5 feet below ground surface (bgs) and B-3 was drilled to 55 feet bgs (Figure 2). Three soil samples from each boring were analyzed for Total Petroleum Hydrocarbons as gasoline (TPHg) and benzene, toluene, ethylbenzene, and xylenes (BTEX), except for a sample collected at 35 feet bgs from B-1 (sample S-35-B1) which was also analyzed for Total Petroleum Hydrocarbons as diesel (TPHd). A sample collected at 10 feet bgs from B-3 was reported as not detected for all analytes. The remaining samples contained petroleum hydrocarbons at concentrations ranging from 7.72 to 188.8 parts per million (ppm) of TPHg and 0.07 to 17.1 ppm of benzene. Sample S-35-B1 also contained 1,325 ppm of TPHd. Groundwater was not encountered in the borings (AGS, 1987).

On August 21, 1987, soil boring B-4 was advanced by AGS to a total depth of 66.5 feet bgs (Figure 2). One soil sample collected at 35 feet bgs contained 100.5 ppm of TPHg, 1.4 ppm of benzene, and 1,835 ppm of TPHd. A second soil sample collected at 65 feet bgs was reported as not detected for TPHg, TPHd, and BTEX. Groundwater was not encountered in the boring (AGS, 1987a).

On December 2 through 7, 1987, AGS advanced three soil borings (B-5, B-6, B-7) to a total depth of 96.5 feet bgs and completed the borings as groundwater monitoring wells MW-1, MW-2, and MW-3 (Figure2). The wells were completed at depths of 96.5, 85, and 96.5 feet bgs, respectively. Saturated soil was initially encountered at approximately 80 feet bgs. Two soil samples collected at 35 and 70 feet bgs in boring B-5 were reported as not detected for TPHg, TPHd, and BTEX. One soil sample collected at 35 feet bgs in boring B-6 contained 15.0 ppm of TPHg, 6,300 ppm of TPHd and was not detected for benzene. One soil sample collected at 70 feet bgs in Boring B-6 were reported as not detected for TPHg, TPHd, and BTEX. A sample collected at 55 feet bgs in boring B-7 contained 390 ppm of TPHg, 1.3 ppm of benzene, and 220 ppm of TPHd. A sample collected at 75 feet bgs in boring B-7 contained 5.0 ppm of TPHg, 30.0 ppm of TPHd, and was not detected for BTEX. Groundwater samples collected from well MW-1, MW-2, and MW-3 contained petroleum hydrocarbon concentrations ranging from 0.0500 to 24.000 ppm of TPHg, 0.058 to 2.600 ppm of benzene, and 0.620 to 2.300 ppm of TPHd (AGS, 1987b).

A 1/2-mile radius well survey was performed by AGS in late 1987 or early 1988. A review of the Alameda County Flood Control and Water Conversation District - Zone 7 (Zone 7) files identified five water wells and two cathodic protection wells within the 1/2-mile radius of the site. Four of the five water wells are domestic wells and the fifth appears to be a monitoring well (AGS, 1987b and KEI, 1996).

Reportedly, in December 1987, the four 12,000-gallon USTs were replaced with two 12,000-gallon double-wall USTs. An unknown volume of contaminated soil was reportedly removed and transported to a Class I facility. The property and facilities were sold to the Unocal Corporation in February 1988 (KEI, 1996 and Enviros, 1995).

In September 1994, KEI performed soil sampling services during a dispenser and product piping upgrade at the site. A total of twelve trench soil samples were collected at approximately 3 feet bgs. Petroleum hydrocarbons were detected in the samples at concentrations ranging from not detected to 8,900 ppm of TPHg, and not detected to 65 ppm of benzene. Upon receipt of the analytical data, overexcavation was performed in the area of two soil samples with elevated hydrocarbon concentrations. Three soil samples were collected at approximately 9 feet bgs. The two overexcavation samples were reported to contain 13 and 17 ppm of TPHg and 0.020 to 0.029 ppm of benzene. The third soil sample, collected laterally between the two overexcavation samples contained 4,400 ppm of TPHg and 29 ppm of benzene (KEI, 1994).

On February 6 and 7, 1995, KEI destroyed monitoring well MW-2 and advanced two soil borings (MW-2B and EB-1). Boring MW-2B was completed as a monitoring well. Well MW-2 was destroyed due to asphalt tar being introduced into the well casing during repaving activities at the site. Soil boring EB-1 was drilled to a total depth of 66 feet bgs and well MW-2B was drilled and constructed to a total depth of 91 feet bgs (Figure 2). A total of twenty-nine soil samples were collected during boring EB-1 and MW-2B drilling activities. Samples collected from 5 to 50 feet bgs from EB-1 contained petroleum hydrocarbon concentrations ranging from 27 to 15,000 ppm of TPHg, 0.29 to 340 ppm of benzene, and 55 to 3,600 ppm of TPHd. Samples collected from 55 to 65 feet bgs from EB-1 contained petroleum hydrocarbon concentrations ranging from not detected to 6.4 ppm of TPHg, not detected to 0.89 ppm of benzene, and not detected for TPHd. Soil samples collected from 5 to 65 feet bgs in well boring MW-2B contained petroleum hydrocarbons concentrations ranging from 1.0 to 720 ppm of TPHg, not detected to 9.5 ppm of benzene, and not detected to 2,400 ppm of TPHd. Soil samples collected from 70 to 80 feet bgs in well boring MW-2B were reported as not detected for TPHg, BTEX, and TPHd (KEI, 1995).

Enviros was contracted to perform a Phase I Environmental Site Assessment for the site in early 1995 (Enviros, 1995).

On July 23 and 24, 1996, KEI advanced three soil borings and completed them as groundwater monitoring wells MW-4, MW-5 and MW-6 to total depths of 73.5 to 93 feet bgs. Well MW-4 was installed on-site and wells MW-5 and MW-6 were installed off-site on the former Southern Pacific Railroad right-of-way (Figure 2). A total of forty-seven soil samples were collected from the well borings and analyzed for TPHg, BTEX, and fuel fingerprinting. Soil samples from well boring MW-4 contained low concentrations of petroleum hydrocarbons ranging from not detected to 47 ppm of TPHg, not detected to 0.27 ppm of benzene, not detected to 15 ppm of TPHd. Soil samples collected in the upper 50 feet of well boring and NW-5 were reported as not detected for TPHg and TPHd, and contained benzene in concentrations ranging from not detected to 0.038 ppm. Samples collected

between 55 and 65 feet bgs in MW-5 contained petroleum hydrocarbon concentrations ranging from 32 to 560 ppm of TPHg, 0.28 to 3.9 ppm of benzene, and not detected to 450 ppm of TPHd. Samples collected from MW-6 contain petroleum hydrocarbon concentrations ranging from not detected to 5.0 ppm of TPHg, not detected to 1.2 ppm of benzene, and not detected for TPHd except for 200 ppm detected at 55 feet bgs. Petroleum hydrocarbon concentrations in the range of kerosene, motor oil, and unidentified extractable hydrocarbons were also identified in the samples collected from the well borings (KEI, 1996).

Free product was found in well MW-5 during quarterly monitoring activities on June 27, 1997. In December 1997, (Entrix) performed a forensic geochemical analysis of free product extracted from well MW-5. The Entrix study determined that the free product was most likely composed of a mixture of over 50% refined gasoline and 50% heavier hydrocarbons. The gasoline constituents appeared to be relatively fresh according to Entrix. The heavier hydrocarbon mixture had a carbon distribution ranging from about nC13 to nC33. The distribution is similar in nature to a very weathered crude oil or Bunker C fuel, petroleum products such as diesel #2, motor oil, lube oil, etc., or mixtures of any of the above heavier hydrocarbons (Entrix, 1997).

Five onsite soil borings (B-8 through B-12) were advanced and two offsite downgradient groundwater monitoring wells (MW-7, MW-8) were installed by GR between June and August 1998 (Figure 2). A total of forty soil samples were collected from the soil and well borings and analyzed for TPHg, BTEX, MTBE, TPHd, and TPHo. Petroleum hydrocarbon concentrations in the soil samples range from not detected for all analytes for soil boring B-8 and well boring MW-7, to a maximum of 1,700 ppm of TPHg and 21 ppm of benzene (B-12 at 37.5 feet bgs), 14,000 ppm of TPHd, 2.6 ppm of MTBE (B-12 at 28.5 feet bgs), and 5,200 ppm of TPHo (B-11 at 10.5 feet bgs). Elevated concentrations of petroleum hydrocarbons were concentrated at 24.5 and 31 feet bgs in boring B-10, from the surface to 61 feet bgs in boring B-11, at 28.5, 37.5 and 47 feet bgs in boring B-12, and at 45.5 feet bgs in well boring MW-8. In addition, two soil samples containing visible free product were collected from boring B-11 (near the former UST excavation) at 10.5 and 61 feet bgs and submitted to Global Geochemistry Corp. for hydrocarbon fingerprinting chemical analysis. The results of these analyses was that the free product from both samples was composed of approximately 90% highly to severely weathered semi-volatile and high boiling components identified as crude oil and 10% of slightly weathered gasoline (GR, 1999).

Groundwater has been monitored on a quarterly basis from December 1994 to the present. Groundwater analytical data collected during monitoring indicates that free product or a product sheen has been present in well MW-5 since December 1996. Excluding MW-5, petroleum hydrocarbon concentrations in the groundwater on-and off-site has ranged from not detected to 23,000 ppb of TPHg, not detected to 950 ppb of benzene, not detected to 4,400 ppb of MTBE, and not detected to 4,000 ppb of TPHd. Depth to groundwater has fluctuated from approximately 49.63 to 87.26 feet bgs (GR, 1999a). The encountered water-bearing zone appears to be unconfined and controlled by the discontinuous nature of the alluvial fan deposits. The elevated water table identified in MW-5 ~~is~~ appears to be a result of the discontinuous nature of the alluvial fan deposits that underlie the site.

140107.04

Groundwater flow has ranged from southeast to northwest with a hydraulic gradient of approximately 0.07 to 0.1 feet/feet.

REGIONAL GEOLOGY

The subject site is located at the base of the northwest end of the Valle De San Jose. The site is underlain by Holocene age coarse grain alluvium interpreted to be alluvial fan deposits. These deposits are composed of unconsolidated, well bedded, moderately sorted, permeable sand and silt, with coarse sand and gravel becoming abundant toward fan heads and in narrow canyons (Helley, 1979). The site is also located approximately 1,000 feet west and north of Pliocene and/or Pleistocene non-marine sedimentary Livermore Gravel (Diblee, 1980).

Previous subsurface studies performed by AGS, KEI, and GR indicate the site is underlain by alluvium to a maximum explored depth of 96.5 feet bgs. The alluvium consists of interbedded layers of silts, sands, clays and gravels in both the vadose and saturated zones (KEI, 1996).

Groundwater has been historically reported at approximately 67.15 to 87.26 feet below top of casing (TOC) in wells MW-1, MW-2B, MW-3, MW-4, and MW-6. Groundwater in well MW-5 has been historically reported at 49.63 to 69.47 feet below TOC. The water-bearing zone appears to be unconfined beneath the site. Groundwater in well MW-5 has historically appeared "perched" and unconfined. Water table elevations in well MW-5 are generally 15 feet higher, compared to nearby well water table elevations (wells MW-6, MW-7 and MW-8). A review of Alameda County Flood Control and Water Conversation District-Zone 7 (1993) groundwater data determined that the regional groundwater flow direction in the vicinity of the site was toward the northwest. The nearest surface water is Arroyo Valle, located approximately 700 feet northwest of the site.

FIELD ACTIVITIES

Field work was performed in accordance with the GR Site Safety Plan No. 140107.04, dated October 1, and November 19, 1999. GR Field Methods and Procedures and Site Safety Plan are presented in Appendix B. Underground Service Alert (USA) was notified prior to beginning the drilling activities and a utility locator service was employed to clear each drilling location. Drilling and well installation was performed under Zone 7 Drilling Permit No. 99162 and Alameda County Public Works Agency Roadway Encroachment Permit No. R00-LD0401. A copy of the permits is included in Appendix C.

Soil boring B-13, located approximately 10 feet north of the subject site in an adjacent property's planter, was advanced to a total depth of 135.5 feet below ground surface (bgs) on November 22 and 23, 1999. This boring was advanced to collect additional information regarding the subsurface conditions, geologic information and investigation into the source of the "crude oil" or "heavy" hydrocarbon identified in off-site well MW-5. Two off-site soil borings were drilled on October 7 and November 21, 1999 and completed as groundwater monitoring wells MW-9 and MW-10,

respectively. The wells were installed to total depths of approximately 75 and 100 feet bgs, respectively. The purpose of installing these wells was to delineate impacted groundwater down- and cross-gradient. Locations of the borings and wells are shown on Figure 2.

All borings were drilled using a truck-mounted drill rig equipped with eight-inch diameter hollow stem augers. Drilling was performed by Woodward Drilling Company of Rio Vista, California (#C57 710079). A GR geologist observed the drilling and well installation activities, described the encountered soil, and prepared a log of each boring. Logs of the soil borings are included in Appendix C. Mr. Scott Seery of ACHSCA was present during some of the drilling activities.

Soil cuttings generated during drilling were placed on and covered with plastic sheeting and stored at the site pending disposal. Samples TS-1 (comp) and TS-2 (comp) were collected from the stockpiled soil cuttings and submitted to the laboratory to be composited and analyzed as one sample. Stockpile sampling procedures are presented in Appendix B. Water generated during the cleaning of the drilling equipment was placed in properly labeled drums and stored at the site pending disposal.

Well Installation

Each well was constructed using 2-inch diameter Schedule 40 polyvinyl chloride (PVC) casing and 0.02-inch machine-slotted well screen. The annular space around the well screen in each well boring was packed with Lonestar #3 sand to approximately one foot above the top of the well screen. The sandpack in each well was followed by a bentonite transition seal and then completed with neat cement. The top of each well is protected by a vault box, locking well cap, and lock. Well construction details are included on the boring logs in Appendix C.

Well Monitoring, Development, and Sampling

Monitoring, development, and sampling of the two newly installed and six existing wells were performed by GR personnel. Copies of the well development and field monitoring data sheets are included in Appendix D.

Well MW-9 was developed on November 29, 1999 and sampled during the 4th Quarter 1999 monitoring and sampling event on December 6, 1999. Depth to groundwater in MW-9 was measured and checked for the presence of floating product prior to development. The well did not dewater during development, and yielded a minimum of 10 well casing volumes of purge water. Quarterly groundwater monitoring was performed and groundwater samples were collected in appropriate containers supplied by the laboratory. Well MW-10 was found to be dry on November 29 and December 6, 1999. Approximately 0.82 feet of floating product was measured in well MW-5 on December 6, 1999. Purge water generated during development and sampling procedures was discharged to a truck-mounted tank, then transported to the Tosco Refinery in Rodeo, California for disposal. Monitoring data are summarized in Table 1.

Wellhead Survey

Following installation of the wells, the well casing elevations were surveyed by Virgil Chavez Land Surveying of Vallejo, California (California Land Surveyor No. 6323). Top of casing and vault box elevations were measured relative to MSL, and the horizontal locations of the wells surveyed. Horizontal locations of soil boring B-13 and other pertinent equipment were also surveyed. Well casing elevations are summarized in Table 1. A copy of the surveyor's report is included in Appendix E.

SUBSURFACE CONDITIONS

The unsaturated (vadose) zone is comprised predominantly of fill material overlying a fine-grained unit containing discontinuous strata, overlying a predominantly coarse-grained unit with silt and clay strata. The saturated zone is comprised of interbedded silts, sands, clay and gravels. Groundwater was initially encountered at depths of approximately 61.5 to 77 feet bgs. Two geologic cross sections (A-A' on Figure 3 and B-B' on Figure 4) were constructed from data generated during recent and previous drilling activities. Cross section locations are shown on Figure 2.

Prior to quarterly groundwater sample collection on December 6, 1999, GR personnel measured the depth to groundwater in wells MW-1 through MW-5 and MW-7 through MW-9 at 70.02 to 92.23 feet below top of well casing. Floating product was observed in well MW-5 during the December 6, 1999 monitoring episode. Wells MW-6 and MW-10 contained insufficient groundwater to measure. These data were used to construct a Potentiometric Map (Figure 5). Based on these data, the Potentiometric Map depicts a general groundwater flow of north with a calculated hydraulic gradient of 0.095 to 0.111 feet/feet. Well MW-4 displayed an anomalous depth to water of 92.23 feet below TOC, which was not used for construction of the Potentiometric Map. The groundwater in MW-4 may have been trapped in the bottom of the well casing, and therefore not representative of actual groundwater conditions. This map suggests the water in well MW-5 is perched relative to the other wells. The difference in the groundwater elevations may also be a result of lithological or structural constraints, or possibly some offset or displacement in the soils beneath the site in the area between MW-2B and MW-5 (Figures 3 and 4). The encountered water-bearing zone(s) appears to be unconfined.

CHEMICAL ANALYTICAL RESULTS

A total of twenty-eight soil samples from the soil borings, two composite samples from the stockpiled drill cuttings, five grab groundwater samples and eight groundwater monitoring well samples were collected and submitted for chemical analysis. Soil samples were selected using OVM data and geologic interpretation. Analyses of soil, grab groundwater, and monitoring well groundwater samples were performed by Sequoia Analytical of Redwood City, California (ELAP #1210). Two soil samples were tested for specific physical parameters to be used in future RBCA evaluations were

performed by PTS Laboratories, Inc. of Santa Fe Springs, California. Copies of the laboratory reports and chain-of-custody forms are included in Appendix F.

Chemical Analytical Procedures

Selected soil samples from the borings were analyzed for total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene and xylenes (BTEX), and methyl tert-butyl ether (MtBE) according to Environmental Protection Agency (EPA) Method 5030/8015/8020. Grab groundwater samples were analyzed for TPHg, BTEX, and MTBE by EPA Methods 8020 and 8260. Quarterly groundwater samples were analyzed for TPHd, TPHg, BTEX, and MTBE by EPA Method 8020 and sample MW-9 was also analyzed for oxygenate compounds by EPA Method 8260. Soil stockpile sample TS-1 (comp) was analyzed for TPHg, BTEX, total lead, and reactivity, corrosivity and ignitability (RCI). Soil stockpile sample TS-2 (comp) was analyzed for TPHg, TPHd, TPHo, BTEX, total lead, STLC lead, and RCI. Quarterly groundwater chemical analytical data are summarized in Table 1 and shown on Figure 5. Grab groundwater sample chemical analytical data are summarized in Table 2 and shown on Figure 7. Soil chemical analytical data are summarized in Table 3 and shown on Figures 3 and 4.

Soil Chemical Analytical Results

Soil Boring B-13

Nine soil samples collected from boring B-13 between 7.5 and 73.5 feet bgs contained petroleum hydrocarbons in concentrations ranging from not detected to 14,000 ppm of TPHg and an unidentified hydrocarbon with a carbon chain range of greater than C10, not detected to 100 ppm of benzene, and not detected to 0.18 ppm of MTBE. The highest petroleum hydrocarbon concentrations were identified at 28 and 46 feet bgs. Five soil samples collected between 85.5 and 126 feet bgs did not contain any petroleum hydrocarbons. Soil chemical analytical data are summarized in Table 3 and shown on Figure 4.

Well Boring MW-9

No petroleum hydrocarbons were detected in five soil samples collected between 16 and 60.5 feet bgs. In addition, field screening procedures conducted on retrieved soil samples also indicated an absence of petroleum hydrocarbons in well boring MW-9. Soil chemical analytical data are summarized in Table 3.

Well Boring MW-10

Nine soil samples collected from well boring MW-10 between 5.5 and 90.5 feet bgs were reported as not detected for TPHg, benzene, and MTBE, except for 9.7 ppm of TPHg and 0.035 ppm of benzene detected in the sample collected at 38 feet bgs and 240 ppm of TPHg and unidentified hydrocarbons

with a carbon chain range of C6-C12, 0.71 ppm of benzene, and 1.2 ppm of MTBE (not detected by EPA Method 8260) in the sample collected at 56 feet bgs. No soil samples were collected between 56 and 70 feet bgs due to the overdrilling and recovery of a piece of broken downhole drilling equipment. Soil chemical analytical data are summarized in Table 3 and shown on Figure 3.

Groundwater Chemical Analytical Results

Monitoring Well Groundwater Samples

Groundwater samples MW-1 through MW-4 and MW-7 through MW-9 were collected on December 6, 1999. The groundwater sample collected from MW-4 may have been collected from groundwater trapped in the bottom of the well casing, and therefore not representative of actual groundwater conditions. Approximately 0.82 feet of floating product was measured in Well MW-5. Wells MW-6 and MW-10 did not contain adequate groundwater for sample collection. Petroleum hydrocarbons were detected in all groundwater samples at concentrations ranging from not detected to 41,000 ppb (MW-3) of TPHg, not detected to 3,200 ppb (MW-3) of benzene, not detected to 4,200 ppb (MW-3) of TPHd, and not detected to 4,400 ppb (MW-2B) of MTBE. TPHg and TPHd concentrations detected also contained discrete peaks and unidentified hydrocarbons outside of normal TPHg and TPHd parameters. In addition, groundwater sample MW-9 was reported as not detected for oxygenate compounds except for 2.7 ppb of MTBE. See Table 1 for specific notes and explanations. Groundwater analytical data are illustrated on Figure 6.

Grab Groundwater Samples

Grab groundwater sample G-1, collected from a perched groundwater zone at 55 feet bgs in boring MW-9, was reported as not detected at elevated detection limits for TPHg and BTEX, and 88 and 66 ppb of MTBE by EPA Methods 8020 and 8260, respectively.

A grab groundwater sample collected from well boring MW-10 at 90 feet bgs was reported as not detected for TPHg and benzene, and contained 28 and 34 ppb of MTBE by EPA Methods 8020 and 8260, respectively. A Hydropunch groundwater sample collected from boring MW-10 at 95 feet bgs was reported as not detected at an elevated detection limit for benzene, and contained 230 ppb of TPHg, and 52 and 54 ppb of MTBE by EPA Methods 8020 and 8260, respectively.

A grab groundwater sample collected from boring B-13 at 128.5 feet bgs contained 150 ppb of TPHg, 17 ppb of benzene, and 2.7 and 3.5 ppb of MTBE by EPA Methods 8020 and 8260, respectively. A Hydropunch groundwater sample collected from boring B-13 at 133 feet bgs contained 620 ppb of TPHg, 53 ppb of benzene, and 26.9 and 3.7 ppb of MTBE by EPA Methods 8020 and 8260, respectively. No grab or Hydropunch groundwater samples were collected above 128.5 feet bgs due to insufficient groundwater. Grab groundwater sample chemical analytical data are summarized in Table 2. These data were used to construct the attached groundwater concentration map (Figure 7).

Stockpile Chemical Analytical Results

Soil stockpile sample TS-1(comp) was reported as not detected for TPHg and BTEX, and contained allowable concentrations of total lead. Soil stockpile sample TS-2 (comp) was reported as not detected for MTBE and STLC lead, and contained 25 ppm of TPHg, 0.011 ppm of benzene, 10 ppm of TPHd, 21 ppm of TPHo, 51 ppm of total lead. Sample analytical data are summarized in Table 3.

RBCA Sample Results

Two soil samples (MW-10-3.5 and MW-10-13) were collected at 3.5 and 13 feet bgs, respectively from well boring MW-10, and analyzed for specific physical parameters. These data were collected for the possible future use in a RBCA evaluation. The PTS Laboratories, Inc. analytical report is included in Appendix E.

WASTE DISPOSAL

Approximately 116 gallons of waste water generated by cleaning the drilling equipment and well development procedures were removed from the site by GR, and transported to the Tosco Refinery in Rodeo, California, for treatment. A total of 9.81 tons of soil (drill cuttings) were removed from the site by Denbeste Transportation, Inc. of Windsor, California and transported to the Forward Incorporated facility in Manteca, California for disposal. A copy of the Forward disposal confirmation forms are included in Appendix G.

DISCUSSION

The purpose of this investigation was to collect additional site data to better understand the geology, potential migratory pathways, and determine whether petroleum hydrocarbons are present below the first regional aquifer through the installation of soil boring B-13. In addition, monitoring wells MW-9 and MW-10 were installed down- and cross-gradient of the site to delineate the dissolved hydrocarbons.

Geology and soil analytical data for soil boring B-13 resembles data previously derived from soil boring B-11 and well boring MW-2B. The highest concentrations of petroleum hydrocarbons in soil were encountered at 28 feet bgs (14,000 ppm of TPHg and 100 ppm of benzene). Soil samples collected below 85 feet bgs were reported as not detected for all petroleum hydrocarbons. Although groundwater-saturated soils were encountered at approximately 25, 66, 93, and 106 feet bgs, first sampleable groundwater was not encountered until 127 feet bgs. Grab and Hydropunch groundwater samples were collected at 128.5 and 133 feet bgs and contained detectable concentrations of petroleum hydrocarbons.

No petroleum hydrocarbons were detected in the soil samples collected from downgradient well boring MW-9. A perched zone grab groundwater sample collected at 55 feet bgs was reported as not

detected at an elevated detection limit for TPHg and BTEX and contained 88 and 66 ppb of MTBE by EPA Methods 8020 and 8260, respectively. The groundwater sample for MW-9 collected during the recent quarterly monitoring and sampling event was reported as not detected for TPHg and BTEX and contained 3.0 and 2.7 ppb of MTBE by EPA Methods 8020 and 8260, respectively. The screened interval for well MW-9 is from 55 to 75 feet bgs. Depth to groundwater in well MW-9 has ranged from 73.90 to 74.50 feet below TOC.

Lithology encountered in well boring MW-10 resembles lithology previously encountered in soil boring B-12. Petroleum hydrocarbon concentrations were only detected in soil samples from B-13 at depths of 38 and 56 feet bgs. The sample collected at 38 feet bgs contained 9.7 ppm of TPHg and 0.035 ppm of benzene and the sample collected at 56 feet bgs contained 240 ppm of TPHg, 0.71 ppm of benzene, and 1.2 ppm of MTBE. The grab groundwater sample collected at 90 feet bgs was reported as not detected for TPHg and benzene, and contained 28 and 34 ppb of MTBE by EPA Methods 8020 and 8260, respectively. The subsequent Hydropunch groundwater sample collected at 95 feet bgs was reported as not detected for benzene and contained 230 ppb of TPHg and 52 ppb (EPA 8020) and 54 ppb (EPA 8260) of MTBE. A Hydropunch sample was attempted at 100 feet bgs, but was not successful. Upon construction of well MW-10, groundwater was measured at approximately 90.55 feet bgs. No groundwater was detected in well MW-10 on November 29, 1999 during planned well development activities.

Geologic and hydraulic data generated during this investigation suggest the hydrogeologic conditions responsible for the elevated or perched water table identified in wells MW-5 MW-7, MW-8 and MW-9 as possibly a result of the discontinuous nature of the alluvial fan deposit or some small off-set or displacement of the soils that underlies the site (see cross-sections on Figures 3 and 4). Physical evidence of a possible fault or displacement feature still has not been identified and is suggested based on the cross-section interpretation.

Groundwater data from the grab/Hydropunch and quarterly groundwater samples indicate that petroleum hydrocarbons are present in groundwater at low concentrations down- and cross-gradient (north and northeast) of the site. The dissolved groundwater is predominantly defined downgradient. The vertical extent is most complex, given the imbricated potentiometric surface demonstrated at the site. First sampleable groundwater in boring B-13, located in the "displaced zone", was at 128.5 feet bgs. This is approximately 40 feet deeper than MW-3, which is located 40 feet away from B-13. The groundwater samples collected from B-13 contained very low concentrations of TPHg, benzene, and MTBE.

DISTRIBUTION

GR recommends that a copy of this report be forwarded to Mr. Chuck Headlee of the California Regional Water Quality Control Board, San Francisco Bay Region at 1515 Clay Street Suite 1400, Oakland, California 94612 and Mr. Scott Seery of the Alameda County Health Care Services Agency at 1131 Harbor Bay Parkway, 2nd Floor, Alameda, California 94502.

Table 1

Groundwater Monitoring Data and Analytical Results

Tosco (Unocal) Service Station #7376

4191 First Street

Pleasanton, California

EXPLANATIONS:

Groundwater monitoring data and laboratory analytical results prior to March 16, 1998, were compiled from reports prepared by MPDS Services, Inc.

TOC = Top of Casing
DTW = Depth to Water
(ft.) = Feet
GWE = Groundwater Elevation
msl = Relative to mean sea level
TPH(G) = Total Petroleum Hydrocarbons as Gasoline

B = Benzene
T = Toluene
E = Ethylbenzene
X = Xylenes
MTBE = Methyl tertiary butyl ether

ppb = Parts per billion
ND = Not Detected
-- = Not Measured/Not Analyzed

* TOC elevations have been surveyed relative to mean sea level (msl) per City of Pleasanton Benchmark V1, a brass disk on the north curb of Ray Street, approximately 200 feet northwest of the centerline of First Street (Elevation = 367.17 feet msl). On March 22, 1999, MW-8 was re-surveyed and on November 26, 1999, MW-9 and MW-10 were surveyed, the Benchmark was a cut "+" on a concrete transformer pad on the north side of the property to the northwest (Elevation = 353.92 feet, msl).

** Groundwater elevation corrected for the presence of free product; correction factor = [(TOC-DTW)+(Product Thickness x 0.75)].

1 1,2-Dichloroethene (1,2-DCE) was detected at a concentration of 18 ppb.
2 Reported as Total Extractable Hydrocarbons (TEH).
3 Reported as Total Petroleum Hydrocarbons (TPH).
4 Laboratory report indicates the hydrocarbons detected appeared to be a diesel and non-diesel mixture.
5 Laboratory report indicates the hydrocarbons detected did not appear to be diesel.
6 Laboratory has potentially identified the presence of MTBE at reportable levels in the groundwater sample collected from this well.
7 Laboratory has identified the presence of MTBE at a level above or equal to the taste and odor threshold of 40 ppb in the sample collected from this well.
8 Laboratory report indicates the hydrocarbons detected appeared to be a gasoline and non-gasoline mixture.
9 Laboratory report indicates the hydrocarbons detected did not appear to be gasoline.
10 Laboratory report indicates diesel and unidentified hydrocarbons >C16.
11 Detection limit raised. Refer to analytical reports.
12 Laboratory report indicates gasoline and unidentified hydrocarbons <C7.
13 Laboratory report indicates discrete peaks.
14 Laboratory report indicates diesel and unidentified hydrocarbons >C20.
15 Laboratory report indicates discrete peaks and unidentified hydrocarbons <C7.
16 Laboratory report indicates diesel and unidentified hydrocarbons <C15.
17 Laboratory report indicates diesel and unidentified hydrocarbons <C15 and >C20.
18 Laboratory report indicates gasoline and unidentified hydrocarbons >C8.
19 Laboratory report indicates unidentified hydrocarbons >C16.
20 Laboratory report indicates unidentified hydrocarbons C9-C24.
21 Laboratory report indicates diesel and unidentified hydrocarbons <C12.
22 Laboratory report indicates unidentified hydrocarbons C6-C12.
23 Laboratory report indicates unidentified hydrocarbons C6-C9.

Table 1

Groundwater Monitoring Data and Analytical Results

Tosco (Unocal) Service Station #7376

4191 First Street

Pleasanton, California

---

[24] Laboratory report indicates unidentified hydrocarbons >C14.

[25] Laboratory report indicates unidentified hydrocarbons >C10.

[26] Laboratory report indicates unidentified hydrocarbons >C9.

[27] MTBE by EPA Method 8260. Other oxygenate compounds were reported as not detected.

[28] Laboratory report indicates unidentified hydrocarbons >C15.

[29] Laboratory report indicates gasoline and unidentified hydrocarbons >C6.

[30] Laboratory report indicates gasoline C6-C12.

[31] Laboratory report gasoline C6-C12 + unidentified hydrocarbons <C6.

[32] Laboratory report indicates unidentified hydrocarbons C9-C40.

TABLE 2 - GRAB GROUNDWATER CHEMICAL ANALYTICAL DATA

Tosco (Unocal) Service Station No. 7376
4191 First Street
Pleasanton, California

Sample Location and ID	Sample Depth (feet)	Date Collected	TPHg (ppb)	Benzene (ppb)	Toluene (ppb)	Ethyl-benzene (ppb)	Xylenes (ppb)	MTBE by 8020/8260 (ppb)
Boring B-13								
B-13-128.5	128.5	11/23/99	150	17	13	7.6	35	2.7/3.5
B-13-133	133	11/23/99	620	53	43	30	140	6.9/3.7
Well Boring MW-9								
G-1	55	10/7/99	ND‘	ND‘	ND‘	ND‘	ND‘	88/66
Well Boring MW-10								
MW-10-90	90	11/21/99	ND	ND	ND	ND	1.1	28/34
MW-10-95	95	11/21/99	230	ND‘	ND‘	ND‘	4.6	52/64

EXPLANATION:

feet = feet below ground surface
ppb = parts per billion
ND = not detected

ANALYTICAL LABORATORY:

Sequoia Analytical (ELAP #1210)

ANALYTICAL METHODS:

TPHg = Total Petroleum Hydrocarbons as gasoline according to EPA Method 8015 Modified.
BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes according to EPA Method 8020.
MTBE = Methyl t-Butyl Ether according to EPA Methods 8020 and 8260.

‘ Elevated detection limit. See analytical report for limits.

TS-2 comp[5]	--	11/23/99	25[3]	0.011	0.052	0.14	0.66	ND

ANALYTICAL METHODS:

TPHg = Total Petroleum Hydrocarbons as gasoline according to EPA Method 8015 Modified.
BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes according to EPA Method 8020.
MtBE = Methyl t-Butyl Ether according to EPA Method 8020.

ANALYTICAL LABORATORY:

Columbia Analytical Services(ELAP #1426)

EXPLANATION:

feet = feet below ground surface
ppm = parts per million
ND = Not Detected
NA=not analyzed
[1] = Chromatograph pattern indicates gasoline C6-C12 and unidentified hydrocarbons >C10.
[2] = Elevated detection limit. See analytical report for limits.
[3] = Chromatograph pattern indicates gasoline C6-C12 and unidentified hydrocarbons C6-C12.
[4] = The sample was also analyzed for total lead (34 ppm), reactivity (ND), corrosivity (7.93 pH) and ignitability (>100 degrees celsius).
[5] = This sample was also analyzed for TPH diesel (10 ppm), TPH motor oil (21ppm), total lead (51 ppm), STLC lead (ND), reactivity (ND), corrosivity (8.10 pH), and ignitability (>100 degrees celsius).
[6] = The sample was also reported as ND for MtBE by EPA Method 8260 which was analyzed after the two week hold time had passed.

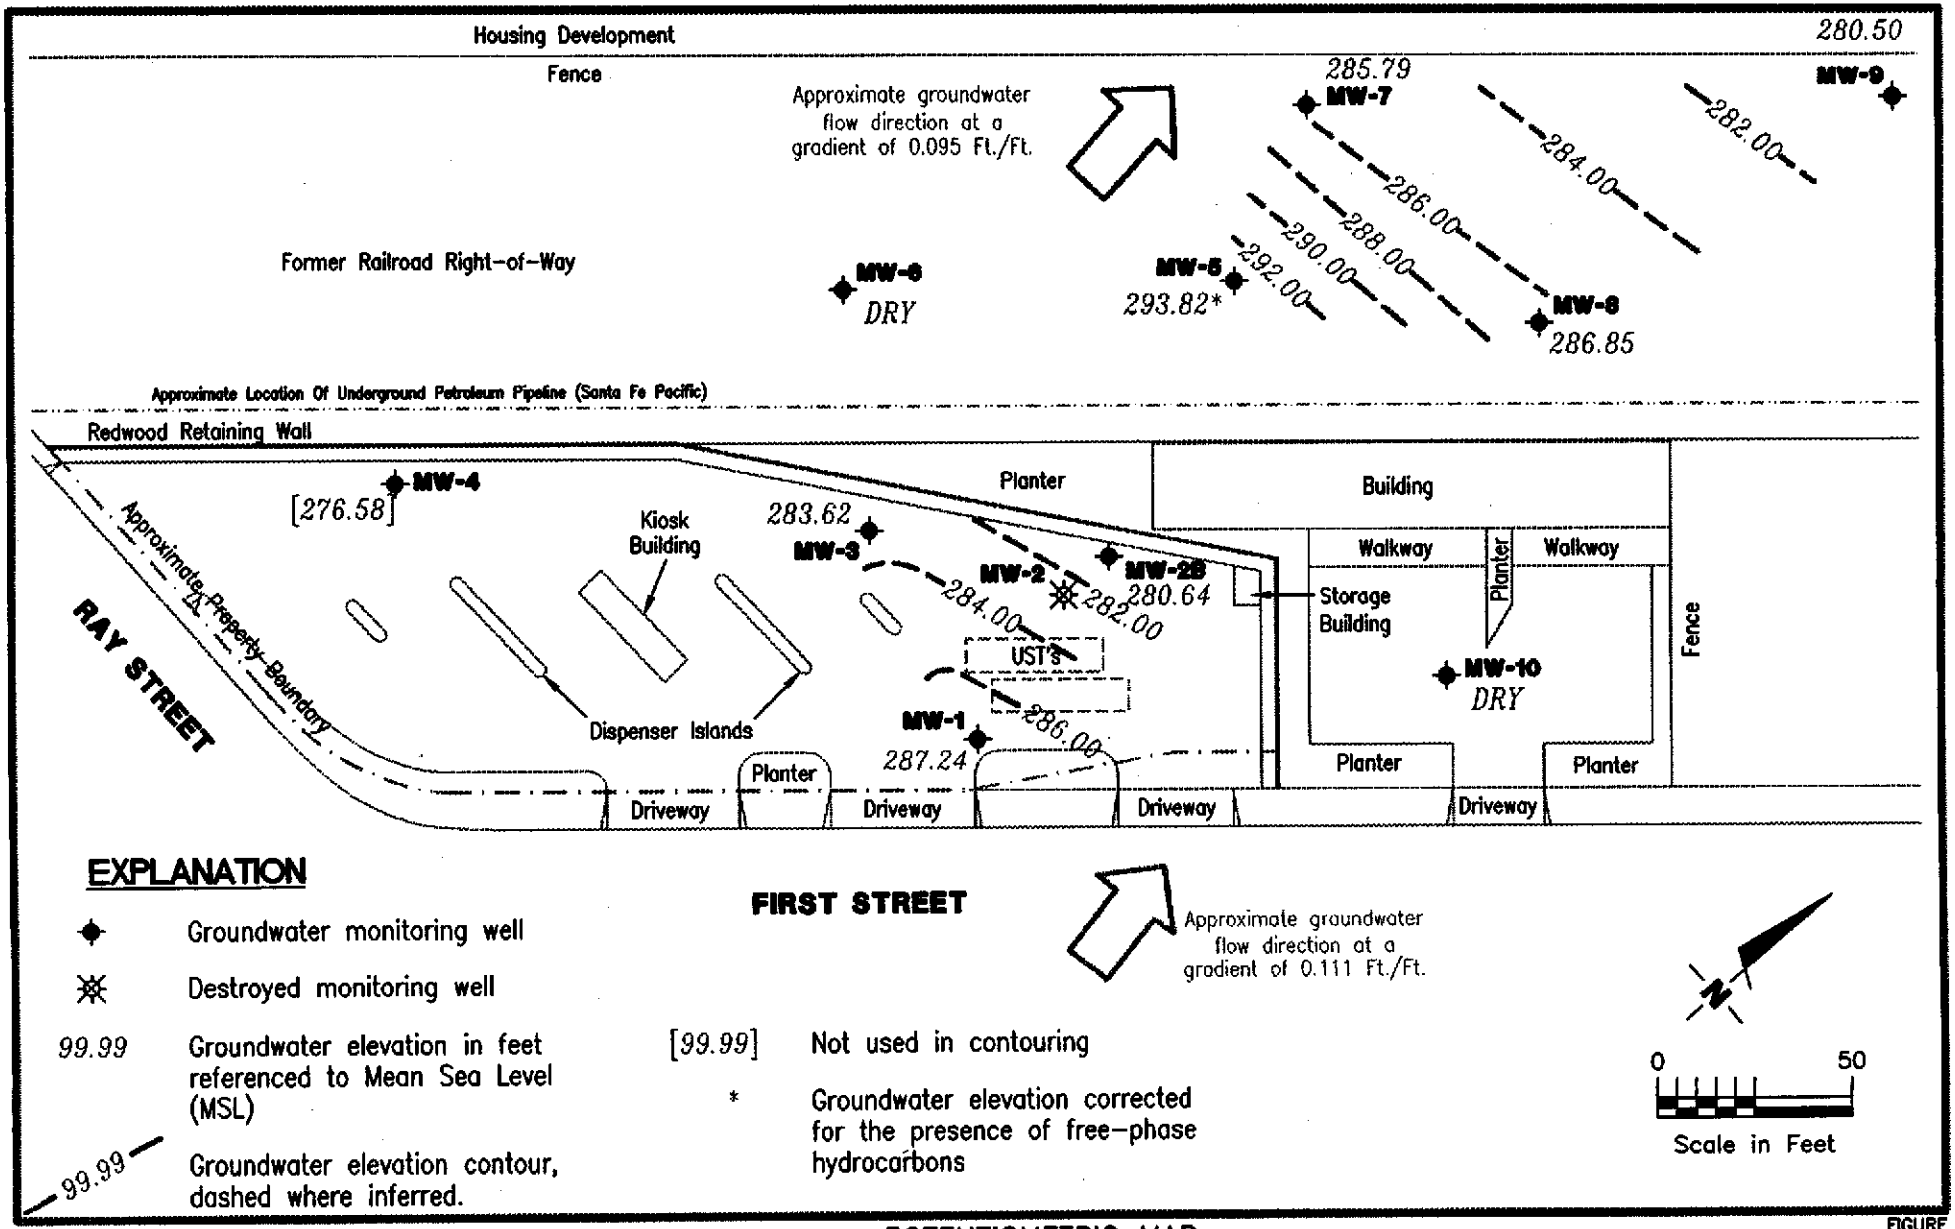
DATE 10/98

REVIEWED BY

JOB NUMBER 140107.04



EXPLANATION

- ✦ Groundwater monitoring well
- ✳ Destroyed monitoring well
- 99.99 Groundwater elevation in feet referenced to Mean Sea Level (MSL)
- 99.99 Groundwater elevation contour, dashed where inferred.
- [99.99] Not used in contouring
- * Groundwater elevation corrected for the presence of free-phase hydrocarbons

Gettler - Ryan Inc.

* Sequoia Analytical Laboratory reported that the hydrocarbons detected appeared to be a diesel and non-diesel mixture.

** Sequoia Analytical Laboratory reported that the hydrocarbons detected did not appear to be diesel.

♦ Sequoia Analytical Laboratory reported that the hydrocarbons detected appeared to be a gasoline and non-gasoline mixture.

♦♦ Sequoia Analytical Laboratory reported that the hydrocarbons detected did not appear to be gasoline.

NOTE: The soil samples were collected at the depths below grade indicated in the ( ) of the respective sample number.

ND = Non-detectable.

Results are in milligrams per kilogram (mg/kg), unless otherwise indicated.

ANALYTICAL METHODS:

TPHg = Total Petroleum Hydrocarbons as gasoline according to EPA Method 8015 Modified.
BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes according to EPA Method 8020.
MtBE = Methyl t-Butyl Ether according to EPA Method 8020.

ANALYTICAL LABORATORY:

Columbia Analytical Services(ELAP #1426)

EXPLANATION:

feet = feet below ground surface
ppm = parts per million
ND = Not Detected
[1] = Sample contains components that eluted in the diesel range, but the chromatogram does not match the typical diesel fingerprint.
[2] = This sample was analyzed for CAM 17 metals. Concentrations were below allowable levels for disposal.
[3] = Elevated detection limit. See analytical report for detection limits.

APPENDIX B

GR Field Methods and Procedures

GETTLER-RYAN INC.
FIELD METHODS AND PROCEDURES

Site Safety Plan

Field work performed by Gettler-Ryan Inc. (GR) is conducted in accordance with GR's Health and Safety Plan and the Site Safety Plan. GR personnel and subcontractors who perform work at the site are briefed on the of these plans contents prior to initiating site work. The GR geologist or engineer at the site when the work is performed acts as the Site Safety Officer. GR utilizes a photoionization detector (PID) to monitor ambient conditions as part of the Health and Safety Plan.

Collection of Soil Samples

Exploratory soil borings are drilled by a California-licensed well driller. A GR geologist is present to observe the drilling, collect soil samples for description, physical testing, and chemical analysis, and prepare a log of the exploratory soil boring. Soil samples are collected from the exploratory soil boring with a split-barrel sampler or other appropriate sampling device fitted with clean brass or stainless steel liners. The sampling device is driven approximately 18 inches with a 140-pound hammer falling 30 inches. The number of blows required to advance the sampler each successive 6 inches is recorded on the boring log. The encountered soil is described using the Unified Soil Classification System (ASTM 2488-84) and the Munsell Soil Color Chart.

After removal from the sampling device, soil samples for chemical analysis are covered on both ends with teflon sheeting or aluminum foil, capped, labeled, and placed in a cooler with blue ice for preservation. A chain-of-custody form is initiated in the field and accompanies the selected soil samples to the analytical laboratory. Samples are selected for chemical analysis based on:

a. depth relative to underground storage tanks and existing ground surface
b. depth relative to known or suspected groundwater
c. presence or absence of contaminant migration pathways
d. presence or absence of discoloration or staining
e. presence or absence of obvious gasoline hydrocarbon odors
f. presence or absence of organic vapors detected by headspace analysis

Field Screening of Soil Samples

A PID is used to perform head-space analysis in the field for the presence of organic vapors from the soil sample. This test procedure involves removing some soil from one of the sample tubes not retained for chemical analysis and immediately covering the end of the tube with a plastic cap. The PID probe is inserted into the headspace inside the tube through a hole in the plastic cap. Head-space screening results are recorded on the boring log. Head-space screening procedures are performed and results recorded as reconnaissance data. GR does not consider field screening techniques to be verification of the presence or absence of hydrocarbons.

Stockpile Sampling

Stockpile samples consist of four individual sample liners collected from each 100 cubic yards (yd^3) of stockpiled soil material. Four arbitrary points on the stockpiled material are chosen, and discrete soil sample is collected at each of these points. Each discrete stockpile sample is collected by removing the upper 3 to 6 inches of soil, and then driving the stainless steel or brass tube into the stockpiled material with a wooden mallet or hand driven soil sampling device. The sample tubes are then covered on both ends with teflon sheeting or aluminum foil, capped, labeled, placed in the

cooler with blue ice for preservation. A chain-of-custody form is initiated in the field and accompanies the selected soil samples to the analytical laboratory. Stockpiled soils are covered with plastic sheeting after completion of sampling.

Construction of Monitoring Wells

Monitoring wells are constructed in the exploratory borings with Schedule 40 polyvinyl Chloride (PVC) casing. All joints are thread-joined; no glues, cements, or solvents are used in well construction. The screened interval is constructed of machine-slotted PVC well screen which generally extends from the total well depth to a point above the groundwater. An appropriately-sized sorted sand is placed in the annular space adjacent to the entire screened interval. A bentonite transition seal is placed in the annular space above the sand, and the remaining annular space is sealed with neat cement or cement grout.

Wellheads are protected with water-resistant traffic rated vault boxes placed flush with the ground surface. The top of the well casing is sealed with a locking cap. A lock is placed on the well cap to prevent vandalism and unintentional introduction of materials into the well.

Storing and Sampling of Drill Cuttings

Drill cuttings are stockpiled on plastic sheeting or stored in drums depending on site conditions and regulatory requirements. Stockpile samples are collected and analyzed on the basis of one composite sample per 50 cubic yards of soil. Stockpile samples are composed of four discrete soil samples, each collected from an arbitrary location on the stockpile. The four discrete samples are then composited in the laboratory prior to analysis.

Each discrete stockpile sample is collected by removing the upper 3 to 6 inches of soil, and then driving the stainless or brass sample tube into the stockpiled material with a hand, mallet, or drive sampler. The sample tubes are then covered on both ends with teflon sheeting or aluminum foil, capped, labeled, and placed in a cooler with blue ice for preservation. A chain-of-custody form is initiated in the field and accompanies the selected soil samples to the analytical laboratory. Stockpiled soils are covered with plastic sheeting after completion of sampling.

Wellhead Survey

The top of the newly-installed well casing is surveyed by a California-licensed Land Surveyor to mean sea level (MSL).

Well Development

The purpose of well development is to improve hydraulic communication between the well and surrounding aquifer. Prior to development, each well is monitored for the presence of separate-phase hydrocarbons and the depth-to-water is recorded. Wells are then developed by alternately surging the well with the bailer, then purging the well with a pump to remove accumulated sediments and draw groundwater into the well. Development continues until the groundwater parameters (temperature, pH, and conductivity) have stabilized.

Groundwater Monitoring and Sampling

Decontamination Procedures

All physical parameter measuring and sampling equipment are decontaminated prior to sample collection using Alconox or equivalent detergent followed by steam cleaning with deionized water. During field sampling, equipment placed in a well are decontaminated before purging or sampling the next well by cleaning with Alconox or equivalent detergent followed by steam cleaning with deionized water.

Water-Level Measurements

Prior to sampling each well, the static water level is measured using an electric sounder and/or calibrated portable oil-water interface probe. Both static water-level and separate-phase product thickness are measured to the nearest ± 0.01 foot. The presence of separate-phase product is confirmed using a clean, acrylic or polyvinylchloride (PVC) bailer, measured to the nearest ± 0.01 foot with a decimal scale tape. The monofilament line used to lower the bailer is replaced between borings with new line to preclude the possibility of cross-contamination. Field observations (e.g. product color, turbidity, water color, odors, etc.) are noted. Water-levels are measured in wells with known or suspected lowest dissolved chemical concentrations to the highest dissolved concentrations.

Sample Collection and Labeling

A temporary PVC screen is installed in the boring to facilitate a grab groundwater sample collection. Samples of groundwater are collected from the surface of the water in each well or boring using the teflon bailer or a pump. The water samples are then gently poured into laboratory-cleaned containers and sealed with teflon-lined caps, and inspected for air bubbles to check for headspace. The samples are then labeled by an adhesive label, noted in permanent ink, and promptly placed in an ice storage. A Chain-of-Custody Record is initiated and updated throughout handling of the samples, and accompanies the samples to the laboratory certified by the State of California for analyses requested.

Permits, Boring Logs, and Well Construction Details

ALAMEDA COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT
5997 PARKSIDE DRIVE • PLEASANTON, CALIFORNIA 94588-5127 • PHONE (925) 484-2600 FAX (925) 462-3914

September 2, 1999

Mr. Clyde Galantine
Gettler-Ryan, Inc.
6747 Sierra Court, Suite J
Djublin, CA 94568

Dear Mr. Galantine:

Enclosed is drilling permit 99162 for a monitoring well construction project at 4191 First Street in Pleasanton for Tosco Marketing Company.

Please note that permit condition A-2 requires that a well construction report be submitted after completion of the work. The report should include drilling and completion logs, location sketch, and permit number. Please submit the original of your completion report. We will forward your submittal to the California Department of Water Resources.

If you have any questions, please contact me at extension 235 or Matt Katen at extension 234.

Sincerely,

Wyman Hong

PERMIT CONDITIONS

Circled Permit Requirements Apply

(A.) GENERAL
1. A permit application should be submitted so as to arrive at the Zone 7 office five days prior to proposed starting date.
2. Submit to Zone 7 within 60 days after completion of permitted work the original Department of Water Resources Water Well Drillers Report or equivalent for well projects, or drilling logs and location sketch for geotechnical projects.
3. Permit is void if project not begun within 90 days of approval date.

B. WATER SUPPLY WELLS
1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.

(C.) GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS
1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.

D. GEOTECHNICAL. Backfill bore hole with compacted cuttings or heavy bentonite and upper two feet with compacted material. In areas of known or suspected contamination, tremied cement grout shall be used in place of compacted cuttings.

E. CATHODIC. Fill hole above anode zone with concrete placed by tremie.

F. WELL DESTRUCTION. See attached.

Vallejo, California 94590-5907
(707) 553-2476 • Fax (707) 553-8698

December 1, 1999
Project No. 1604-20

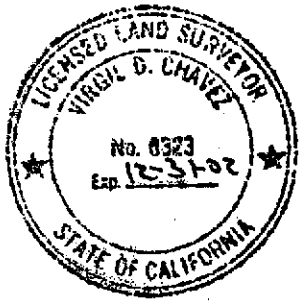
Clyde Galantine
Gettler-Ryan, Inc.
6747 Sierra Ct. Suite J
Dublin, Ca. 94568

Subject: Monitoring Well Survey
Unocal Service Sta. #7376
4191 First Street
Pleasanton, Ca.

Dear Clyde:

This is to confirm that we have proceeded at your request to survey the locations and elevations of MW-9, MW-10, and boring "B-13", at the above referenced location. The survey was performed on November 26, 1999. The benchmark for the survey was a cut "+" on a concrete transformer pad on the north side of the property to the northwest of this site. The coordinates are based on the same datum as used for previous surveys of this site.
Benchmark Elev. = 353.92 feet, MSL.

Well No.	Rim/Ground Elevation	TOC Elevation	Northing	Easting
MW - 9	352.68 Grd	354.85'	5280.415	5073.902
MW -10	363.14 Rim	362.62'	5095.175	5126.269
B -13	364.65 Grd	---	5040.891	5015.039



Sincerely,

Virgil D. Chavez, PLS 6323

Notes and Definitions

P-01	Chromatogram Pattern: Gasoline C6-C12
Q-01	The spike recovery for this QC sample is outside of established control limits. Review of associated batch QC indicates the recovery for this analyte does not represent an out-of-control condition for the batch.
Q-07	The RPD value for this QC sample is above the established control limit. Review of associated QC indicates the high RPD does not represent an out-of-control condition for the batch.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

A-01	Sample was analyzed one day out of hold time due to instrument error.
P-01	Chromatogram Pattern: Gasoline C6-C12
P-04	Chromatogram Pattern: Gasoline C6-C12 + Unidentified Hydrocarbons C6-C12
P-07	Chromatogram Pattern: Gasoline C6-C12 + Unidentified Hydrocarbons >C10
S-01	The surrogate recovery for this sample is not available due to sample dilution required from high analyte concentration and/or matrix interferences.
S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

6747 Sierra Court Suite J	Project Number: Tosco # 7376	**Reported:**
Dublin CA, 94568	Project Manager: Clyde Galantine	26-Oct-99 11:57

Notes and Definitions

F-01	No flash detected up to 100 °C
Q-01	The spike recovery for this QC sample is outside of established control limits. Review of associated batch QC indicates the recovery for this analyte does not represent an out-of-control condition for the batch.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

RE: Tosco

Enclosed are the results of analyses for samples received by the laboratory on 07-Dec-99 14:35. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alan B. Kemp
Laboratory Director

Re: Tosco # 7376/140107.04
PTS File: 29571

Dear Mr. Galantine:

Enclosed are final data for samples submitted from your Tosco 7376 Project # 140107.04. All analyses were performed by applicable ASTM, EPA or API methodology. Samples will be retained for 30 days before disposal unless other arrangements are made.

We appreciate the opportunity to be of service and trust these data will prove beneficial in the development of this project. Please feel free to call myself or Larry Kunkel, District Manager, should you have any questions or require additional information.

Sincerely,

PTS Laboratories, Inc.

Rick Young
Project Manager

Re: ***FORWARD, INC.*** Approval No. 891300
Contaminated Soil from
4191 First Street
PLEASANTON, CA

Dear Mr. Galantine:

FORWARD, INC. is pleased to confirm the disposal of 2.88 tons of material as referenced above. The material was received at our Manteca, California facility for disposal on 11/09/99. The material was placed in a Class 2 waste management unit.

Approval for this material was based on the information provided in the waste profile and associated materials submitted on behalf of Tosco Marketing Company (Generator). Acceptance of the waste is subject to the "Terms and Conditions" agreed to and signed by the Generator on the Waste Profile Form.

Thank you for the opportunity to be of service. Should you have any questions regarding this matter, please contact me or Customer Service at (800) 204-4242.

Sincerely,

FORWARD, INC.

Re: ***FORWARD, INC.*** Approval No. 898500
Contaminated Soil from
Tosco S/S# 7376 - 4191 First Street
Pleasanton, CA

Dear Mr. Galantine:

FORWARD, INC. is pleased to confirm the disposal of 6.93 tons of material as referenced above. The material was received at our Manteca, California facility for disposal on January 3, 2000. The material was placed in a Class 2 waste management unit.

Approval for this material was based on the information provided in the waste profile and associated materials submitted on behalf of Tosco Marketing Company (Generator). Acceptance of the waste is subject to the "Terms and Conditions" agreed to and signed by the Generator on the Waste Profile Form.

Thank you for the opportunity to be of service. Should you have any questions regarding this matter, please contact me or Customer Service at (800) 204-4242.

Sincerely,

FORWARD, INC.
