RE: EXXON RAS #7-3399/2991 Hopyard Road, Pleasanton, California

Dear Mr. Seery:

Attached for your review and comment is a report entitled *Quarterly Ground Water Monitoring and Remediation System Status Report, Fourth Quarter 1997* for the above referenced site. This report was prepared by Delta Environmental Consultants, Inc., of Rancho Cordova, California, and summarizes sampling activities conducted on December 30, 1997.

If you have any questions or comments, please contact me at (510) 246-8776.

Sincerely,

Marla D. Guensler
Senior Engineer

MDG/tjm

Subject: *Quarterly Ground Water Monitoring and
Remediation System Status Report, Fourth Quarter 1997*
Exxon Service Station No. 7-3399
2991 Hopyard Road
Pleasanton, California
Delta Project No. D094-836

Dear Ms. Guensler:

Delta Environmental Consultants, Inc. (Delta), has been authorized by Exxon Company, U.S.A. (Exxon), to conduct quarterly ground water monitoring at Exxon Service Station No. 7-3399, located at 2991 Hopyard Road, Pleasanton, California. This report presents the results of quarterly ground water monitoring and sampling conducted for the fourth quarter 1997. The location of the site is shown in Figure 1 and site features are illustrated in Figure 2. Work conducted at the site by Delta was performed in accordance with the field methods and procedures described in Enclosure A.

Ground Water Elevation Measurements, Flow Direction, and Hydraulic Gradient

On December 30, 1997, ground water elevations were measured in on-site monitoring wells MW-1, MW-4, MW-7, MW-8, MW-9, and MW-10 and off-site monitoring wells MW-5D, MW-5S, and MW-11. Depth to ground water in the monitoring wells ranged from 36.74 (MW-1) to 39.81 (MW-8) feet below the top of the well casings. Ground water elevation levels increased an average of 1.17 feet in the monitoring wells since the September 23, 1997, monitoring event. Cumulative ground water elevation measurements recorded are presented in Table 1.

A ground water elevation contour map was constructed from the ground water elevations recorded on December 30, 1997, and is included as Figure 3. The ground water elevation measurements from monitoring wells MW-5D and MW-8 were not included in the ground water elevation contour map, because these wells are screened in a lower zone; additionally the measurement obtained from monitoring well MW-9 was not used due to air sparging within this well. The ground water elevation contours, illustrated in Figure 3, indicate that ground water in the upper water-bearing zone generally flowed toward the northeast with an area of mounding around MW-1. Based on the ground water elevation contour map, the hydraulic gradient is approximately 0.01.

Ms. Marla Guensler
Exxon Company, U.S.A.

Subjective Analysis

No liquid-phase petroleum hydrocarbons or hydrocarbon sheens were present in the wells during the December 1997 sampling visit.

Ground Water Analytical Results

Ground water samples were collected from monitoring wells MW-1, MW-4, MW-5S, MW-5D, MW-7, MW-8 and MW-9 on December 30, 1997. As requested by Alameda County Health Agency, duplicate samples labeled MW-5DD and MW-8D were collected from MW-5D and MW-8, respectively. Samples labeled MW-5DR and MW-8DR were rinseate samples collected following decontamination procedures of field equipment. All ground water samples were submitted to Sequoia Analytical (a California-certified laboratory) for analysis of benzene, toluene, ethylbenzene, and total xylenes (BTEX), and methyl tertiary butyl ether (MTBE) using EPA Method 8020, total purgeable petroleum hydrocarbons (TPPH) as gasoline using EPA Method 8015 Modified, fuel oxygenate compounds: ethanol, t-butanol, MTBE, di-isopropyl ether, ethyl t-butyl ether, and t-amyl methyl ether, using EPA Method 8260, and industrial solvent as methanol using EPA Method 8015 Modified. Monitoring wells MW-4 and MW-7 have been reduced to an annual sampling frequency, and were not sampled during the current event. Monitoring wells MW-10 and MW-11 will continue to be excluded from quarterly sampling as analytical results of ground waters samples collected from these wells have historically been non-detect.

The analytical results reported that all analytes were below the laboratory's limits of detection, with the exception of the samples obtained from monitoring wells MW-8DR, and MW-9. Detectable concentrations of benzene and TPPH as gasoline were reported in the ground water sample collected from monitoring well MW-9 at 840 micrograms per liter ($\mu\text{g/L}$) and 4,600 $\mu\text{g/L}$, respectively. A benzene concentration map based on the December 30, 1997, analytical results is included in Figure 4. Detectable concentrations of MTBE ranged from 3.2 $\mu\text{g/L}$ in the sample collected from MW-8DR to 1,100 $\mu\text{g/L}$ (MW-9). Cumulative ground water analytical results are presented in Table 1, and a copy of the laboratory analytical report for the December 30, 1997, sampling event is included in Enclosure B.

Remediation System Status

A soil vapor extraction (SVE), air sparging, and bio-venting system has been installed to remediate petroleum hydrocarbon constituents in soil and ground water underlying the site. The SVE system was shut down on December 29, 1993, due to low influent concentrations, then restarted on August 14, 1997.

The SVE system consists of vapor recovery well VR-4, a vacuum blower, and two 200-pound vapor phase granular activated carbon columns in series. Air is injected into VR-3 and MW-9. Vapor recovery wells VR-1 and VR-2 are not presently in use. The locations of the wells and equipment compound are illustrated in Figure 2, and a process flow diagram of the SVE system is included as Figure 5.

Ms. Marla Guensler
Exxon Company, U.S.A.
February 12, 1998
Page 3

Delta collects influent, mid-carbon, and effluent soil vapor samples on a monthly basis during those months the system is operational. The samples are submitted to Sequoia Analytical for analysis of BTEX and TPPH as gasoline. Results of the SVE system sampling are summarized in Table 2, and a copy of the laboratory analytical reports are submitted to the Bay Area Air Quality Management District in compliance with the permit to operate.

Discussion

Concentrations of hydrocarbons in samples collected from monitoring wells MW-8 and MW-5D, which are screened across a lower water-bearing zone, were below the laboratory's limits of detection for all analytes. Analytical results from duplicate samples from MW-5D and MW-8, and the rinseate sample from MW-5D were below the laboratory's limit of detection for all analytes. The concentrations of MTBE and toluene in the rinseate sample collected from MW-8R may be attributed to contamination of the surrounding environment at the surface as this sample was collected after decontamination procedures. Monitoring of residual dissolved hydrocarbons in the deep monitoring well will continue, due to the proximity of the City of Pleasanton municipal wells northeast of the site.

Future Work

The next quarterly monitoring event for this site is scheduled for March 1998.

Remarks/Signatures

The interpretations contained in this report represent our professional opinions, and are based in part, on information supplied by the client. These opinions are based on currently available information and are arrived at in accordance with currently accepted hydrogeologic and engineering practices at this time and location. Other than this, no warranty is implied or intended.

Delta recommends that copies of this report be forwarded to:

^a Water level recorded during pumping of MW-7.

^b Anomalous water level possibly due to recharge from a perched water zone.

^c Casing head cut to lower elevation.

^d Casing head damaged by construction.

^e Results obtained past the technical holding time.

^f Methyl tertiary butyl ether.

Reference elevation = Elevation relative to mean sea level.

Depth to ground water = Measured from notch/mark on north edge of well casing.

µg/L = Micrograms per liter.

TPPH = Total purgeable petroleum hydrocarbons.

MTBE = Methyl tertiary butyl ether using EPA Method 8020.

Oxygenate compounds = Ethanol, tertiary butanol, methyl tertiary butyl ether, diisopropyl ether, ethyl tertiary butyl ether, tertiary amyl methyl ether.

Concentrations confirmed using EPA Method 8260.

LPH = Liquid-phase petroleum hydrocarbons.

NS = Not sampled.

NM = Not measured.

NC = Not calculated.

NA = Not analyzed.

NOTE: Elevation detection limit quantified by multiplying laboratory limits by report limit multiplication factor.

ENCLOSURE A

Field Methods and Procedures

FIELD METHODS AND PROCEDURES

1.0 GROUND WATER AND LIQUID-PHASE PETROLEUM HYDROCARBON DEPTH ASSESSMENT

A water/petroleum interface probe was used to assess the liquid-phase petroleum hydrocarbons (LPH) thickness if present, and a water level indicator was used to assess ground water depth in monitoring wells that do not contain LPH. Depth to ground water was measured from the top of each monitoring well casing. The tip of the water level indicator was subjectively analyzed for hydrocarbon sheen. All measurements and physical observations were recorded in the field.

2.0 SUBJECTIVE ANALYSIS OF GROUND WATER

Prior to purging, a water sample was collected from the monitoring well for subjective assessment. The sample was retrieved by gently lowering a clean, disposable bailer to approximately one-half the bailer length past the air/liquid interface. The bailer was then retrieved and the sample contained within the bailer was examined for floating LPH and the appearance of an LPH sheen.

3.0 MONITORING WELL PURGING AND SAMPLING

Monitoring wells were purged using a centrifugal pump until pH, temperature, and conductivity of the purge water had stabilized and a minimum of three well volumes of water had been removed. Ground water removed from the wells was stored in 55-gallon barrels at the site. The barrels were labeled with corresponding monitoring well numbers and the date of purging. After purging, ground water levels were allowed to stabilize. A ground water sample was then removed from each of the wells using a disposable bailer. If the well was purged dry, it was allowed to sufficiently recharge and a sample was collected. Samples were collected in air-tight vials, appropriately labeled, and stored on ice from the time of collection through the time of delivery to the laboratory. A chain-of-custody form was completed to document possession of the samples. Ground water samples were transported to the laboratory and analyzed within the EPA-specified holding times for the requested analyses. Purge water will be collected from the storage barrels in a vacuum truck and transported to an appropriate facility for treatment and/or disposal.

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

QUALITY CONTROL DATA REPORT

Analyte:	Methanol	Ethanol	Iso-Propanol
QC Batch#:	GC010698ISHSHSA	GC010698ISHSHSA	GC010698ISHSHSA
Analy. Method:	ISHS	EPA 8020	EPA 8020
Prep. Method:	HS	HS	HS

Analyst:	T. Tran	T. Tran	T. Tran
MS/MSD #:	9712F9701	9712F9701	9712F9701
Sample Conc.:	N.D.	N.D.	N.D.
Prepared Date:	1/6/98	1/6/98	1/6/98
Analyzed Date:	1/6/98	1/6/98	1/6/98
Instrument I.D. #:	GCV1	GCV1	GCV1
Conc. Spiked:	8.0 mg/L	8.0 mg/L	8.0 mg/L
Result:	8.7	9.8	9.7
MS % Recovery:	109	123	121
Dup. Result:	8.8	9.4	9.0
MSD % Recov.:	110	118	113
RPD:	1.1	4.2	7.5
RPD Limit:	0-50	0-50	0-50

LCS #:	BLK010798	BLK010798	BLK010798
Prepared Date:	1/7/98	1/7/98	1/7/98
Analyzed Date:	1/7/98	1/7/98	1/7/98
Instrument I.D. #:	GCV1	GCV1	GCV1
Conc. Spiked:	8.0 mg/L	8.0 mg/L	8.0 mg/L
LCS Result:	8.3	8.8	8.5
LCS % Recov.:	104	110	106

MS/MSD	50-150	50-150	50-150
LCS Control Limits	50-150	50-150	50-150

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.
