Re: Former Chevron Service Station # 9-8139
16304 Foothill Blvd.
San Leandro, California

Dear Mr. Seery:

Please find attached the report of stockpile sampling conducted by Gettler-Ryan, Inc. during service station construction activities at the referenced site.

Please feel free to contact me at (925) 842-8898 if you have any questions or comments regarding this report.

Sincerely,

Thomas K. Bauhs
Project Manager

9/9

November 8, 1999

Mr. Brett Hunter
Chevron Products Company
P.O. Box 6004
San Ramon, California 94583

Subject: Stockpile Sampling During Construction of New Service Station Facility at Former Chevron Service Station #9-8139, 16304 Foothill Boulevard, San Leandro, California.

Mr. Hunter:

At the request of Chevron Products Company (Chevron), Gettler-Ryan Inc. (GR) conducted a stockpile sampling during construction of a new service station facility at the above referenced site. Construction work was conducted by Wendt Construction (WC). The GR scope of work included: collecting and analyzing soil samples for disposal characterization from the soil stockpiles generated during excavation of the new underground storage tank (UST) pit and utility trenches, and during site grading; evaluating soil disposal options; and preparing a report documenting the work. Sampling was performed in accordance with the GR Field Methods and Procedures (attached), and the GR Site Safety Plan. Soil samples collected during this investigation were delivered under chain-of-custody to Sequoia Analytical in Walnut Creek (ELAP #1271). Analytical methods and results are summarized in Table 1. Copies of the laboratory analytical reports and chain-of-custody records are attached.

On June 7, 1999, GR personnel sampled soil generated during excavation of the new UST pit. Nine 4-point composite soil samples (Comp-A through Comp-I) were collected from arbitrary locations on the soil stockpile. The stockpile samples were submitted to the laboratory for compositing and analyses of total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by Environmental Protection Agency (EPA) Methods 8020/8015, and total lead by EPA Method 6010. In addition, samples Comp-B and Comp-C were analyzed for volatile organic compounds (VOCs) by EPA Method 8010. The soil generated during excavation of the new UST pit was removed from the site on July 14 and 15, 1999, by Allwaste Transportation and Remediation Inc. (Allwaste). Approximately 900 cubic yards of soil were hauled to the Redwood Landfill in Novato, California.

On September 8, 1999, GR personnel sampled soil generated during excavation of utility trenches and site grading activities. Two 4-point composite soil samples (Comp-J and Comp-K) were collected from arbitrary locations on the soil stockpile. The stockpile samples were submitted to the laboratory for compositing and analyses of TPHg, BTEX, MTBE, and total lead. In addition, soil sample Comp-J was

346461.04-1

Stockpile Sampling During Construction of New Service Station Facility - Former Chevron Service Station #9-8139
November 8, 1999

analyzed for VOCs and soluble lead. The soil generated during excavation of utility trenches and site grading was removed from the site on September 15 and 16, 1999, by Allwaste. Approximately 130 cubic yards of soil were hauled to the Redwood Landfill in Novato, California.

On September 21, 1999, GR observed replacement of the wellhead covers on wells EW-2 and EW-3. WC removed the existing concrete vaults, extended the casings to ground surface, backfilled around the well casings with clean fill material, and placed well boxes over the wellheads. The new well casing elevations were not surveyed.

If you should have any questions please call us in Rancho Cordova at (916) 631-1300.

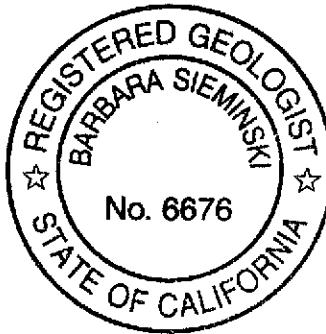

Sincerely,
Gettler-Ryan Inc.

Explanation:

TPHg = Total Petroleum Hydrocarbons as gasoline

MTBE = Methyl tert-butyl ether

ppm = parts per million

NA = not analyzed

Analytical Methods:

TPHg, benzene, toluene, ethylbenzene, xylenes, MTBE: DHS LUFT Methods

Lead: EPA Method 6010

Volatile Organic Compounds: EPA Method 8010

Analytical Laboratory

Sequoia Analytical/Walnut Creek (ELAP #1271)

Notes:¹ Laboratory chromatogram pattern indicates gasoline.² Also analyzed for Volatile Organic Compounds by EPA Method 8010B; none detected.³ For possible disposal purposes, sample was also analyzed for soluble lead by the Soluble Threshold Limit Concentration method using acetic acid (<0.20 ppm) and de-ionized water (<0.20 ppm) extractants.

GETTLER-RYAN INC.

FIELD METHODS AND PROCEDURES

Site Safety Plan

Field work performed by Gettler-Ryan Inc. (GR) is conducted in accordance with GR's Health and Safety Plan and the Site Safety Plan. GR personnel and subcontractors who perform work at the site are briefed on the contents of these plans prior to initiating site work. The GR geologist or engineer at the site when the work is performed acts as the Site Safety Officer. GR utilizes a photoionization detector (PID) to monitor ambient conditions as part of the Health and Safety Plan.

Storing and Sampling of Soil Stockpiles

Excavated material is stockpiled on and covered with plastic sheeting. Stockpile samples are collected and analyzed for disposal classification on the basis of one composite sample per 100 cubic yards of soil. Stockpile samples are composed of four discrete soil samples, each collected from an arbitrary location on the stockpile. The four discrete samples are then composited in the laboratory prior to analysis.

Each discrete stockpile sample is collected by removing the upper 12 to 18 inches of soil, and then driving the stainless steel or brass sample tube into the stockpiled material with a mallet or drive sampler. The sample tubes are then covered on both ends with teflon sheeting, capped, labeled, and placed in a cooler with blue ice for preservation. A chain-of-custody form is initiated in the field and accompanies the selected soil samples to the analytical laboratory. Stockpiled soils are covered with plastic sheeting after completion of sampling.

Field Screening of Soil Samples

A PID is used to perform head-space analysis in the field for the presence of organic vapors from soil samples. This test procedure involves placing a small amount of the soil to be screened in a sealable plastic bag. The bag is warmed in the sun to allow organic compounds in the soil sample to volatilize. The PID probe is inserted through the wall of the bag and into the headspace inside, and the meter reading is recorded in the field notes. An alternative method involves placing a plastic cap over the end of the sample tube. The PID probe is placed through a hole in the plastic cap, and vapors with the covered tube measured. Head-space screening is performed and results recorded as reconnaissance data only. GR does not consider field screening techniques to be verification of the presence or absence of hydrocarbons.

Please Note:

The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

| % Recovery Control Limits: | 65-135 | 70-130 | 70-130 | 80-120 |
|-----------------------------------|--------|--------|--------|--------|

Please Note:

The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

| % Recovery Control Limits: | 65-135 | 70-130 | 70-130 |
|-----------------------------------|--------|--------|--------|

Please Note:

The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.
