August 8, 1995

Mr. Lynn Walker
Shell Oil Products Company
P. O. Box 4023
Concord, California 94524

RE: **Site Assessment Report**
Former Shell Service Station
2101 Park Boulevard
Oakland, California
WIC 204-5508-1206

Dear Mr. Walker

This report documents site assessment activities performed at the above referenced site (Plates 1 and 2). The work included a well survey, research of adjacent property usage, drilling exploratory borings, installation of 3 groundwater monitoring wells, associated soil and groundwater sampling, and preparation of this report. This work was performed to comply with Alameda County Health Care Services Agency (ACHCSA) and Regional Water Quality Control Board guidelines.

1.0 SITE DESCRIPTION

The subject site is located on the northeast corner of Park Boulevard and Newton Avenue in Oakland, California. The site is currently vacant Goodyear tire service store with a layout including a service building with seven hydraulic lifts, a waste oil tank, and a trash enclosure. The former site layout included three separate generations of underground fuel storage tanks (USTs), a total of three dispenser islands, and two separate generations of waste oil tanks. Plate 2 shows the former locations of these site features along with the existing building features. The site history is documented in Enviros' February 24, 1995 Work Plan.

2.0 SITE RESEARCH

Site research was conducted to determine nearby current property usage and to identify nearby wells within a 1/2 mile radius of the subject site.

A survey of the current property usage within a 2 block radius of the subject site was conducted on May 16, 1995. Property usage in the vicinity of the subject site consists of predominantly residential dwellings and some commercial usage along Park Boulevard. A map of the surrounding area (Plate 3) was prepared and identifies nearby commercial sites

A well survey was conducted through the County of Alameda Public Works Agency which identified wells within a 1/2-mile radius of the subject site. A map and list of the wells present within 1/2-mile of the subject site are presented in Appendix A. The closest wells to the subject site are located upgradient and crossgradient at a distance of more than 800 feet. No wells were identified immediately downgradient of the subject site

3.0 FIELD PROCEDURES

3.1 Exploratory Soil Borings

Nine exploratory soil borings were drilled and sampled on May 16, 1995 using the Geoprobe drilling system. The locations and designations of each boring are shown on Plate 2. Soil samples were collected at five-foot intervals for chemical analysis and lithologic description. One boring (S-G), located east of the former fuel UST was continuously cored.

An Enviros geologist supervised the drilling and described encountered soils using the Unified Soil Classification System and Munsell Color chart. Encountered lithology is described on the exploratory boring logs presented in Appendix A.

Soil samples collected from above the saturated zone in each boring were submitted for laboratory analysis. These sample tubes were covered with Teflon tape, capped, labeled, entered onto a Chain-of-Custody record, and stored in a cooler with ice. The samples were transported to National Environmental Testing, Inc. (NET) of Santa Rosa, California, a state-certified environmental laboratory for analysis.

Selected soil samples from the borings were analyzed for Total Petroleum Hydrocarbons calculated as Gasoline (TPH-G) according to EPA Method 8015 (Modified), and benzene, toluene, ethylbenzene and xylenes (BTEX) according to EPA Method 8020. In addition, the soil sample from Boring S-L was analyzed for volatile organics (VOCs) by EPA Method 8010.

3.2 Monitoring Well Installations

Three additional exploratory soil borings were drilled on June 15, 1995 and completed as a groundwater monitoring wells (Wells S-1, S-2, and S-3). The wells were constructed of 2-inch diameter threaded Schedule 40 PVC well casing. Well screen was placed from 3 to 18 feet below grade, in the first encountered water bearing zone.

Well construction included the placement of Lonestar #2/12 sand to one foot above the top of the screen interval. A one foot thick bentonite seal was placed above the sandpack followed by a concrete seal up to grade. The well was secured with a locking well plug and a vault box. Well completion details are presented on the exploratory boring log contained in Appendix B.

The elevations of the newly installed wells were surveyed to Mean Sea Level datum by a state of California registered Land Surveyor. The top of casing and top of vault box elevations for the well were surveyed to the nearest 0.01 foot

Decontamination Procedures

Drilling and sampling equipment were decontaminated prior to beginning work and between activities performed at each boring. Drilling equipment was inspected prior to drilling each boring.

Soil Stockpile

Less than 5 cubic yards of soil were generated as a result of drilling activities. This soil was placed on and covered with visqueen. The soil stockpile is located along the eastern property boundary. Samples of this soil were collected for chemical analysis of TPH-G, BTEX, and Total Threshold Limit Concentration (TTLC) Lead by EPA Method 7421 to aid in determining a proper disposal facility for the soil. The soil was hauled to Redwood Landfill for disposal on July 21, 1995 by Manley and Sons Trucking of Sacramento, California.

3.3 Groundwater Sampling and Well Development

Exploratory Borings

Water samples were collected from exploratory borings S-D and S-L using the Geoprobe water sampling equipment. These samples were analyzed for TPH-G and BTEX. In addition, the water sample from Boring S-L was analyzed for VOCs. Because of limited groundwater yield from Boring S-L water samples for analysis for Total Petroleum Hydrocarbons calculated as Diesel (TPH-D), Oil and Grease, and ICAP Metals could not be collected.

Monitoring Wells

On June 20, 1995, Blaine Tech Services, Inc. (Blaine) in San Jose, California developed Wells S-1, S-2 and S-3 by surging and purging the wells. Water level measurements and groundwater samples were collected from Wells S-1 through S-3 by Blaine on June 22, 1995. Groundwater samples were transported to NET where they were analyzed for TPH-G and BTEX. Groundwater samples from Well S-1 were also analyzed for Oil and Grease, VOCs, TPH-D, and ICAP Metals.

Quality control samples included a duplicate sample (from Well S-3) and a trip blank.

4.0 FINDINGS

4.1 Geology and Hydrogeology

Lithology encountered during the drilling of the exploratory soil borings consisted predominantly clay (CL) with lesser amounts of silt (ML), clayey sand (SC), sand (SP), and gravel (GM) to a depth of approximately 18 fbg.

First encountered groundwater occurred in Borings S-1 and S-3 at 5 to 5.5 fbg. Groundwater was not encountered in Well S-2 during drilling. Several hours after drilling S-2 groundwater was noted at approximately 17.5 fbg. Groundwater in all three wells later stabilized at approximately 3.5 to 5.5 fbg. Water level data collected on June 22, 1995 were used to construct a groundwater contour map (Plate 4) and to calculate groundwater flow direction and gradient. Groundwater flow direction was determined to be generally southwesterly with an approximate gradient of 0.03.

4.2 Soil Chemical Analytical Data

Soil chemical analytical data are presented in Table 1. The distribution of petroleum hydrocarbons in soils is shown on Plate 3. Certified analytical reports for soils are contained in Appendix C. A summary of the soil chemical analytical results for each boring are presented below.

Former 1st Generation USTs

Soil Borings S-B and S-2 were drilled near the southern property line adjacent to the location of four former USTs. The soil sample from S-B at 3 fbg was found to have non-detectable (ND) concentration of TPH-G and 0.0031 parts per million (ppm) benzene.

Three soil samples from Boring S-2 collected at the depths of 5, 10, and 15 fbg were analyzed for TPH-G and BTEX. The soil sample from 5 fbg contained 200 ppm TPH-G and was ND for benzene. The soil sample from 10 fbg contained 40 ppm TPH-G and was ND for benzene. The soil sample from 15 fbg was ND for both TPH-G and benzene.

Former 2nd Generation USTs

Boring S-C was drilled in the center of the former second generation UST complex. Boring S-F was drilled downgradient of the former second generation UST and Boring S-G was drilled upgradient of the former second generation UST.

Soil samples collected from 5 fbg from Borings S-F and S-G and from 6 fbg in Boring S-C were ND for TPH-G and benzene.

Former 3rd Generation USTs

Boring S-D was drilled in the center of the third generation UST and Boring S-3 was drilled adjacent to and downgradient of this UST complex.

The soil sample collected from 6 fbg from Boring S-D was ND for TPH-G and benzene. The soil sample collected from 5.5 fbg in Boring S-3 contained 550 ppm TPH-G and was ND for benzene. The 10.5 fbg soil sample from S-3 was ND for TPH-G and benzene

Former Dispenser Islands

Three borings (S-H, S-I. and S-J) were drilled in each of three former dispenser island locations. Boring S-H was drilled in the center of the former northwest dispenser island, Boring S-I was drilled in the center of the former southeast dispenser island. and Boring S-J was drilled in the center of the former southwest dispenser island.

The soil sample collected from 6.5 fbg in Boring S-H contained 410 ppm TPH-G and 0.42 ppm benzene. The soil sample collected from 3.5 fbg in Boring S-I contained 170 ppm TPH-G and 0.74 ppm benzene. The soil sample collected from 4 fbg in Boring S-J contained 380 ppm TPH-G and 0.78 ppm benzene.

Waste Oil Tank Borings

Because the existing building is located on top of the former waste oil tank locations borings could not be placed adjacent to the former waste oil tank locations. Boring S-L was added to the scope of work at the request of ACHCSA in the location shown on Plate 2. The location was selected as being the closest downgradient location to the former waste oil tanks. The soil sample collected at 5.5 fbg in this boring was ND for TPH-G, BTEX, and VOCs. (Should have run TEPH(D+G))

Based on the groundwater flow direction determined by the newly installed site wells it appears that Well S-1 is more directly downgradient of the former waste oil tanks than Boring S-L. Soil samples collected from S-1 at 5 and 10 fbg were ND for TPH-G and benzene.

4.3 Groundwater Chemical Analytical Data

Grab groundwater samples were collected from Borings S-D and S-L and were ND for TPH-G and BTEX.

Groundwater samples collected from Well S-1 contained 160 parts per billion (ppb) TPH-G and were ND for benzene. Groundwater samples collected from Well S-2 contained 180 ppb TPH-G and 1.1 ppb benzene. Groundwater samples collected from Well S-3 contained 5,500 ppb TPH-G and 240 ppb benzene.

Groundwater samples collected from Well S-1 were also analyzed for TPH-D. Oil and Grease, VOCs. and ICAP Metals. TPH-D was detected in this sample at a concentration of 360 ppb. VOCs and Oil and Grease were not detected in this sample. The only metal detected at levels exceeding State of California Maximum Contaminant levels for drinking water was chromium at a concentration of 270 ppb.

Groundwater chemical analytical data are presented on Table 2. The distribution of benzene in groundwater is shown on Plate 5. The Blaine groundwater monitoring report is presented in Appendix D.

5.0 CONCLUSIONS

Soils beneath the site consisted predominantly of clay with lesser amounts of silt, clayey sand, sand, and gravel to the total depth explored of approximately 18 fbg. Groundwater was first encountered at approximately 5.5 fbg in Borings S-1 and S-3. Groundwater was not encountered in Boring S-2 during drilling. Groundwater in all three wells later stabilized at depths ranging from 3.5 to 5.5 fbg. Groundwater flow direction was calculated to be generally southwesterly at an approximate gradient of 0.03.

Hydrocarbons were detected in capillary fringe soil samples collected from beneath the three former dispenser island (Borings S-H, S-I, and S-J) at concentrations ranging from 170 ppm to 410 ppm TPH-G. Benzene concentrations in these borings were less than 1 ppm. Boring S-2 located in the southwestern portion of the site contained 200 ppm TPH-G at 5 fbg and 40 ppm TPH-G at 10 fbg. Benzene was not detected in these samples. Soil samples collected from Borings S-C and S-D located in the center of the former 2nd and 3rd generation USTs were ND for TPH-G and benzene.

Groundwater samples from Borings S-D and S-L were ND for TPH-G and benzene. Groundwater samples analyzed from Wells S-1, S-2, and S-3 contained TPH-G at concentrations ranging from 160 to 5,500 ppb and benzene concentrations ranging from ND to 270 ppb. Groundwater samples from Well S-1 were also found to contain 360 ppb TPH-D. Additional analysis of groundwater samples from Well S-1 did not detect the presence of Oil and Grease or VOCs. Chromium was present in the groundwater sample from S-1 at a concentration of 270 ppb.

If you have any questions regarding the contents of this document, please call.

Sincerely,

Enviros, Inc.

Joe W. Neely

WELL INVENTORY FILE

Definitions and abbreviations for items listed in the well inventory file are as follows:

[**WELLNO**] Well number - Wells are numbered according to their location in the rectangular system of the Public Land Survey. The part of the number preceding the slash indicates the township; the part following the slash indicates the range and section number; the letter following the section number indicates the 40-acre subdivision; and the final digit is a serial number for wells in each 40-acre subdivision.

[**DAT**] Date - The month and year when drilling or boring was completed.

[**ELEV**] Surface elevation - The surface elevation of the well, if known, in feet above mean sea level. A zero designates an unknown elevation.

[**TD**] Total depth - The depth of the well. This usually designates the completed well depth. If the well has a well log available on file, then the total drilled depth of the well is given. The inventory does not show total depth data for geotechnical borings. This is because only one state well number is assigned to one boring at a site, and there are usually several borings of different depth.

[**DTW**] Depth to water - This category usually indicates the standing groundwater level in the well on the date of completion. The "depth to first water encountered" is recorded in the inventory when it is the only water level data reported on the well driller's report.

[**USE**] Use - The well use (or in the case of cathodic protection wells and geotechnical borings, the reason for the excavation) as indicated in the well driller's report or data sheets. A plus sign (+) after the well use indicates a well in the current ACFC & WCD monitoring network.

[**ABN**] Abandoned well - A well whose use has been permanently discontinued or which is in such a state of disrepair that no water can be produced. In the inventory, this may include wells which are covered or capped but not properly destroyed.

[DES] Destroyed well - A well that has been properly filled so that it cannot produce water nor act as a vertical conduit for the movement of groundwater.

[DOM] Domestic well - A water well which is used to supply water for the domestic needs of an individual residence or systems of four or less service connections or "hookups".

[INA] Inactive well - A well not routinely operating but capable of being made operable with a minimum of effort. Also called a "standby well".

[IND] Industrial well - A water well used to supply industry on an individual basis.

[IRR] Irrigation well - A water well used to supply water only for irrigation or other agricultural purposes. In the inventory, this category includes large capacity wells as well as small capacity wells for lawn irrigation.

[MON] Monitoring or observation well - Wells constructed for the purpose of observing or monitoring groundwater conditions. (see piezometer).

[MUN] Municipal well - A water well used to supply water for domestic purposes in systems subject to Chapter 7, Part 1,
Division 5 of the California Health and Safety Code. Included are wells supplying public water systems classified by the Department of Health Services. (Also referred to as community water supply wells).

[PIE] Piezometer - A piezometer is a well specifically designated to measure the hydraulic head within a zone small enough to be considered a point as contrasted with a well that reflects the average head of the aquifer for the screened interval.

[STO] Stock - A water well used primarily for livestock.

[TES] Test well and test hole - A test well is constructed for the purpose of obtaining the information needed to design a well prior to its construction. Such wells are not to be confused with "test holes" which are temporary in nature (i.e., uncased excavations whose purpose is the immediate determination of existing geologic and hydrologic conditions). Test wells are cased and can be converted to observation or monitoring wells, and under certain circumstances, to production wells. In the inventory, "TES" includes both test wells and test holes.

[?] Unidentified use - This indicates water wells whose use could not be ascertained from the available well data.

[CAT] Cathodic protection well - Any artificial excavation constructed by any method for the purpose of installing equipment or facilities for the protection from

corrosion by electrochemical methods of metallic equipment (usually piping) in contact with the ground; commonly referred to as cathodic protection.

[**GEO**] Geotechnical boring - A temporary boring made to determine certain engineering properties of soils. An asterisk (*) indicates that the state well number assigned to the boring represents more than one boring at a particular site.

[**LOG**] Log - This category indicates whether a geologic record, or log, for the well or boring is available in the Agency's files. Abbreviations are as follows:

D - well driller's log
G - geotechnical boring log
E - electric (resistivity) log or other subsurface geophysical logs.

[**WQ**] Water quality data available - This category indicates which wells have water quality data available in ACFC & WCD files. The numbers 1 through 9 signify the number of sets of water quality measurements available for that well. A plus sign (+) indicates that 10 or more sets of data are available. A "0" indicates that no data is available.

[**WL**] Water level data available - This category indicates which wells have water level data other than the data reported on the well driller's logs. The numbers 1 through 9 signify the number of water level measurements available. A plus sign (+) indicates that 10 or more measurements are available for that well.
A "0" indicates that no data is available.

[**YLD**] Yield - The maximum pumping rate in gallons per minute that can be supplied by a well without lowering the water level in the well below the pump intake. This data is taken from pump test data recorded in the driller's records. Some of the yield data reflects current production rates and does not reflect maximum yield values determined in a capacity test.

[**DIA**] Diameter - The diameter in inches of the main casing in a well. May also indicate the diameter of a hand-dug well. Diameter data is not recorded for geotechnical borings

KEY TO ABBREVIATIONS and METHOD REFERENCES

<	:	Less than; When appearing in results column indicates analyte not detected at the value following. This datum supercedes the listed Reporting Limit.
*	:	Reporting Limits are a function of the dilution factor for any given sample. To obtain the actual reporting limits for this sample, multiply the stated Reporting Limits by the dilution factor (but do not multiply reported values).
ICVS	:	Initial Calibration Verification Standard (External Standard).
mean	:	Average; sum of measurements divided by number of measurements.
mg/Kg (ppm)	:	Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).
mg/L	:	Concentration in units of milligrams of analyte per liter of sample.
mL/L/hr	:	Milliliters per liter per hour.
MPN/100 mL	:	Most probable number of bacteria per one hundred milliliters of sample.
N/A	:	Not applicable.
NA	:	Not analyzed.
ND	:	Not detected; the analyte concentration is less than applicable listed reporting limit.
NTU	:	Nephelometric turbidity units.
RPD	:	Relative percent difference, 100 [Value 1 - Value 2]/mean value.
SNA	:	Standard not available.
ug/Kg (ppb)	:	Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).
ug/L	:	Concentration in units of micrograms of analyte per liter of sample.
umhos/cm	:	Micromhos per centimeter.

COOLER RECEIPT FORM

Project: 2101 Park Blvd., Oakland, CA Log No: 1689
Cooler received on: 5-17-95 and checked on 5-17-95 by
(signature)

Were custody papers present?.....~~YES~~ NO

Were custody papers properly filled out?.....~~YES~~ NO

Were the custody papers signed?.....~~YES~~ NO

Was sufficient ice used?.....(YES) NO Temp 3.0°

Did all bottles arrive in good condition (unbroken)?.....~~YES~~ NO

Did bottle labels match COC?.....~~YES~~ NO

Were proper bottles used for analysis indicated?.....~~YES~~ NO

Correct preservatives used?.....~~YES~~ NO

VOA vials checked for headspace bubbles?.....YES NO
Note which voas (if any) had bubbles:*

Sample descriptor:	Number of vials:

*All VOAs with headspace bubbles have been set aside so they will not be used for analysis.....YES NO

Please Note
The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

WELL DEVELOPMENT REPORT 950620-D-1

Blaine Tech Services, Inc. performs specialized environmental sampling and documentation as an independent third party. In order to avoid compromising the objectivity necessary for the proper and disinterested performance of this work, Blaine Tech Services, Inc. does not participate in the interpretation of analytical results or become involved with the marketing or installation of remedial systems. The interpretation of results should be performed by representatives of the interested regulatory agencies and those certified professionals who are engaged as paid consultants in the business of providing professional opinions along with recommendations and proposals for further investigative or remedial activities.

As an independent third party, Blaine Tech Services, Inc. routinely performs evacuation and sampling of groundwater wells. In addition, we are frequently asked to provide specialized personnel, instruments and equipment for well development work Similar standards of care and cleanliness are required in all these activities and our personnel are accustomed to the safety measures that must be taken

Scope of Requested Services

Blaine Tech Services, Inc. was asked to provide specialized equipment, instruments and personnel for a well development project being overseen by Joe Neely from Enviros, Inc.

Execution of Recent Work

Our personnel arrived at the site on Tuesday, June 20, 1995 and developed three wells in accordance with our client's specifications communicated to us by Mr. Joe Neely. A summary of the well development actions is presented in the table of field data at the end of this report.

STANDARD PROCEDURES

Overview

Because formations vary in their geologic composition, transmissivity and water production capability, well development cannot be reduced to a set of fixed procedures that will always produce a complete and satisfactory result if just repeated for a predetermined period of time. Instead, well development is accomplished by selecting procedures that (a.) repair that portion of the native formation that was disrupted by the cutting action of the well drilling tool, and (b.) promote the flow of water out of the formation into the newly installed well (through the granular filter pack and well screen). Execution of development actions that are not appropriate to the native formation will be inefficient and in some cases deleterious.

Time constraints usually prevent a precise classification of the saturated zone materials by analysis of soil samples for physical characteristics at a laboratory equipped to do physical testing. Physical tests cannot usually be completed during the brief timespan of a project that combines exploration, design, and well installation into a one day effort. Instead, the subjective judgments of the field geologist are recorded in the boring log and well installation log. The field geologist must quickly evaluate soil types by their appearance and observable characteristics and record his or her estimation of the material in the log according to the categorical judgments provided by the Unified Soil Classification System. These categorical judgments are also the basis for determining the final construction specifications of the well.

The well's total depth, the length of the screened interval, the slot size, and the size of the sand used in the filter pack are all decided on the *appearance* of the soil cuttings and whatever quick tests the field geologist can perform. Because the physical specifications for the well are set at that moment and cannot be corrected later, any misclassification of soil that results in a

mismatching of the well to the native formation will have to be addressed and corrected (to whatever extent is possible) with well development actions, alone.

Well development work can be directed in two ways:

> First, specific well development actions can be called for by the geologist who installed the wells or by another professional reviewing that installation work. Typically, consultants specify the use of certain equipment and techniques.
>
> Second, the consultant or client can define the goal which is being sought and place limits on the amount of effort which should be taken to achieve the goal.

Of the two types of direction, the second is far more common and also more important. Defining the extent of effort which can be expended is vital to controlling costs on a project and scheduling personnel and equipment to complete the work. Moreover, it is possible to undertake and complete work without the added and frequently unnecessary effort of working out very detailed specification which may be impractical or unwarranted. This does not mean that our personnel cannot make use of well installation logs when they are available or are not receptive to very specific directions from the consultant. It does, however, mean that when very detailed directions are given, rapid communication between our personnel and the geologist become very important. This is especially true of sites where multiple wells have been installed, because wells even a short distance apart may demonstrate quite different characteristics which may require a rapid reevaluation of what well development procedures are appropriate in light of the hydrologic condition presented by the native formation at that location on the site.

In most cases, tightly controlled action sequences are less productive than more general directions combined with plain statements of what evaluation criteria should be used for judging the progress and completeness of the well development work. The most common standards are volumetric (removal of set volumes of water), recharge rate, and water clarity (measured as nephelometric turbidity units). Given these goals and limitations, our personnel can proceed with the work without supervision or direction by relying on empirical information obtained directly from the water in the well

Selection of Development Equipment

Each Blaine Tech Services, Inc. vehicle provided for a well development project will have a wide assortment of development tools including stainless steel surgeblocks and swabs, several types of pumps and complete instrumentation for determining standard parameters Special equipment which included certain types of winches, jetting heads, and drop surging pumps can be provided.

General Policy

Truly difficult conditions which can only be resolved by the application of massive force or large volumes of high pressure air should be addressed by a drilling or pump installation contractor. Blaine Tech Services, Inc. is not in the heavy salvage business and has a general policy against the use of tools or techniques which provide enough mechanical advantage to pose a serious risk of damaging a well. The same policy prohibits introducing foreign materials into a well which could carry contaminants into the groundwater. In keeping with this policy, our personnel avoid surging with slugs of effluent water, or jetting with unfiltered air unless these actions are specifically requested by a registered professional who is cognizant of the problems and hazards that accompany the action. In a similar vein, our personnel will, whenever possible, avoid development actions that are likely to seal clay formations or promote bridging, and make every attempt to call obvious indication of such conditions to the attention of the project geologist so that a different regimen can be selected.

Effluent Materials

Groundwater well sampling protocols call for the evacuation of a sufficient volume of water from the well to insure that the sample is collected from the water that has been newly drawn into the well from the surrounding geologic formation.

Well development routinely generates as much or more effluent water as does routine evacuation prior to monitoring. In some cases very large amounts of water must be removed from the well before a satisfactory level of development has been achieved. The effluent water from these development actions must be contained. Blaine Tech Services, Inc. will place this water in appropriate containers of the client's choice or bring new DOT 17 E drums to the site which are appropriate for the containment of the effluent materials.

Decontamination

All apparatus is brought to the site in clean and serviceable condition. The equipment will be decontaminated after use in each well and before leaving the site. Decontamination consists of complete disassembly of the device to a point where a jet of stem cleaner water can be directed onto all internal surfaces. Blaine Tech Services, Inc. frequently modifies apparatus to allow complete disassembly and proper cleaning

Personnel

All Blaine Tech Services, Inc. personnel receive 29 CFR 1910.120 training as soon after being hired as practical. In addition, many of our personnel have additional certifications that include specialized training in level B supplied air apparatus and the supervision of employees working on hazardous materials sites. Employees are not sent to a site and unless we know that they can follow the written provisions of an SSP and the verbal directions of an SSO.

In general, employees sent to a site to perform well sampling will assume an OSHA level D (wet) environment exists unless otherwise informed. The use of gloves and double glove protocols protects both our employees and the integrity of the samples being collected. Additional protective gear and procedures for higher OSHA levels of protection are available.

Please call if we can be of any further assistance.

Richard C. Blaine

QUARTERLY GROUNDWATER SAMPLING REPORT 950622-V-2

This report contains data collected during routine inspection, gauging and sampling of groundwater monitoring wells performed by Blaine Tech Services, Inc. in response to the request of the consultant who is overseeing work at this site on behalf of our mutual client, Shell Oil Company. Data collected in the course of our field work is presented in a TABLE OF WELL GAUGING DATA. The field information was collected during our preliminary gauging and inspection of the wells, the subsequent evacuation of each well prior to sampling, and at the time of sampling.

Measurements taken include the total depth of the well and the depth to water. The surface of water was further inspected for the presence of immiscibles which may be present as a thin film (a sheen on the surface of the water) or as a measurable free product zone (FPZ). At intervals during the evacuation phase, the purge water was monitored with instruments that measure electrical conductivity (EC), potential hydrogen (pH), temperature (degrees Fahrenheit), and turbidity (NTU). In the interest of simplicity, fundamental information is tabulated here, while the bulk of the information is turned over directly to the consultant who is making professional interpretations and evaluations of the conditions at the site.

STANDARD PROCEDURES

Evacuation

Groundwater wells are thoroughly purged before sampling to insure that the sample is collected from water that has been newly drawn into the well from the surrounding geologic formation. The selection of equipment to evacuate each well is based on the physical characteristics of the well and what is known about the performance of the formation in which the well has been installed. There are several suitable devices which can be used for evacuation. The most commonly employed devices are air or gas actuated pumps, electric submersible pumps, and hand or mechanically actuated bailers. Our personnel frequently employ USGS/Middleburg positive displacement pumps or similar air actuated pumps which do not agitate the water standing in the well.

Normal evacuation removes three case volumes of water from the well. More than three case volumes of water are removed in cases where more evacuation is needed to achieve stabilization of water parameters and when requested by the local implementing agency. Less water may be removed in cases where the well dewaters and does not recharge to 80% of its original volume within two hours and any additional time our personnel have reason to remain at the site. In such cases, our personnel return to the site within twenty four hours and collect sample material from the water which has recharged into the well case.

Decontamination

All apparatus is brought to the site in clean and serviceable condition. The equipment is decontaminated after each use and before leaving the site. Effluent water from purging and on-site equipment cleaning is collected and transported to Shell's Martinez Manufacturing Complex in Martinez, California.

Free Product Skimmer

The column headed, VOLUME OF IMMISCIBLES REMOVED (ml) is included in the TABLE OF WELL GAUGING DATA to cover situations where a free product skimming device must be removed from the well prior to gauging. Skimmers are installed in wells with a free product zone on the surface of the water. The skimmer is a free product recovery device which often prevents normal well gauging and free product zone measurements. The 2.0" and 3 0" PetroTraps fall into the category of devices that obstruct normal gauging. In cases where the consultant elects to have our personnel pull the skimmers out of the well and gauge the well, our personnel perform the additional task of draining the accumulated free product out of the PetroTrap before putting it back in the well. This

recovered free product is measured and logged in the VOLUME OF IMMISCIBLES REMOVED column. Gauging at such sites is performed in accordance with specific directions from the professional consulting firm overseeing work at the site on Shell's behalf.

Sample Containers

Sample material is collected in specially prepared containers which are provided by the laboratory that performs the analyses.

Sampling

Sample material is collected in stainless steel bailer type devices normally fitted with both a top and a bottom check valve. Water is promptly decanted into new sample containers in a manner which reduces the loss of volatile constituents and follows the applicable EPA standard for handling volatile organic and semi-volatile compounds.

Following collection, samples are promptly placed in an ice chest containing prefrozen blocks of an inert ice substitute such as Blue Ice or Super Ice. The samples are maintained in either an ice chest or a refrigerator until delivered into the custody of the laboratory.

Sample Designations

All sample containers are identified with a site designation and a discrete sample identification number specific to that particular groundwater well. Additional standard notations (e.g. time, date, sampler) are also made on the label.

Chain of Custody

Samples are continuously maintained in an appropriate cooled container while in our custody and until delivered to the laboratory under a standard Shell Oil Company chain of custody. If the samples are taken charge of by a different party (such as another person from our office, a courier, etc.) prior to being delivered to the laboratory, appropriate release and acceptance records are made on the chain of custody (time, date, and signature of the person releasing the samples followed by the time, date and signature of the person accepting custody of the samples).

Hazardous Materials Testing Laboratory

The samples obtained at this site were delivered to National Environmental Testing, Inc. in Santa Rosa, California. NET is a California Department of Health Services certified Hazardous Materials Testing Laboratory and is listed as DOHS HMTL #178.

Objective Information Collection

Blaine Tech Services, Inc. performs specialized environmental sampling and documentation as an independent third party. In order to avoid compromising the objectivity necessary for the proper and disinterested performance of this work, Blaine Tech Services, Inc. performs no consulting and does not become involved in the marketing or installation of remedial systems of any kind. Blaine Tech Services, Inc. is concerned only with the generation of objective information, not with the use of that information to support evaluations and recommendations concerning the environmental condition of the site. Even the straightforward interpretation of objective analytical data is better performed by interested regulatory agencies, and those engineers and geologists who are engaged in the work of providing professional opinions about the site and proposals to perform additional investigation or design remedial systems.

Reportage

Submission of this report and the attached laboratory report to interested regulatory agencies is handled by the consultant in charge of the project. Any professional evaluations or recommendations will be made by the consultant under separate cover.

Please call if we can be of any further assistance.

KEY TO ABBREVIATIONS and METHOD REFERENCES

<	:	Less than; When appearing in results column indicates analyte not detected at the value following. This datum supercedes the listed Reporting Limit.
*	:	Reporting Limits are a function of the dilution factor for any given sample. To obtain the actual reporting limits for this sample, multiply the stated Reporting Limits by the dilution factor (but do not multiply reported values).
ICVS	:	Initial Calibration Verification Standard (External Standard).
mean	:	Average; sum of measurements divided by number of measurements.
mg/Kg (ppm)	:	Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).
mg/L	:	Concentration in units of milligrams of analyte per liter of sample.
mL/L/hr	:	Milliliters per liter per hour.
MPN/100 mL	:	Most probable number of bacteria per one hundred milliliters of sample.
N/A	:	Not applicable.
NA	:	Not analyzed.
ND	:	Not detected; the analyte concentration is less than applicable listed reporting limit.
NTU	:	Nephelometric turbidity units.
RPD	:	Relative percent difference, 100 [Value 1 - Value 2]/mean value.
SNA	:	Standard not available.
ug/Kg (ppb)	:	Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).
ug/L	:	Concentration in units of micrograms of analyte per liter of sample.
umhos/cm	:	Micromhos per centimeter.

COOLER RECEIPT FORM

Project: 210 Pond Blvd. / 950622-V2 Log No: 7323
Cooler received on: 6/29/95 and checked on 6/29/95 by
(signature)

Were custody papers present?.....~~YES~~ NO

Were custody papers properly filled out?.....~~YES~~ NO

Were the custody papers signed?.....~~YES~~ NO

Was sufficient ice used?.....~~YES~~ NO TEMP: 1.0°C

Did all bottles arrive in good condition (unbroken)?.....~~YES~~ NO

Did bottle labels match COC?.....~~YES~~ NO

Were proper bottles used for analysis indicated?.....~~YES~~ NO

Correct preservatives used?.....~~YES~~ NO

VOA vials checked for headspace bubbles?.....~~YES~~ NO
Note which voas (if any) had bubbles:*

Sample descriptor:	Number of vials:
TB	1

*All VOAs with headspace bubbles have been set aside so they will not be used for analysis.....YES NO
