Re: **Safety-Kleen Corp. Service Center**
400 Market Street
Oakland, California

Dear Ms. Eberle:

Enclosed is the quarterly report which summarizes the groundwater monitoring and vapor extraction activities conducted at the above-referenced facility. This report covers the period from March through May 1995.

As described in the letter submitted on July 13, 1994, and modified and approved by Alameda County in a response letter dated July 27, 1994, Safety-Kleen is following the modified groundwater sampling schedule.

If you have any questions, please call me at (503) 655-2769.

Sincerely,

A handwritten signature in black ink that appears to read "Greg Hoehn".

1.0 INTRODUCTION

This report presents the results of groundwater monitoring and sampling activities conducted for the quarter of March through May 1995, at the Safety-Kleen Service Center located at 400 Market Street in Oakland, California (Figure 1 and Figure 2). Also included are the results of the soil vapor extraction (SVE) system operation.

2.0 PROJECT BACKGROUND INFORMATION

The Safety-Kleen Oakland Service Center is a local distribution center for Safety-Kleen products. Three single-walled underground storage tanks (USTs) were removed and replaced with two new 12,000 gallon double-walled tanks in June and July of 1990. Product and waste mineral spirits are currently stored in the two double-walled USTs at the site. One UST is used to consolidate waste mineral spirits prior to shipment to a Safety-Kleen Recycle Center and one UST is used for distribution of product mineral spirits to Safety-Kleen customers.

During the single-walled tank removal, mineral spirits impacted soil was excavated from the tank pit as allowable by site conditions. Additionally, a product recovery well and a vapor extraction system withdrawal network were installed in the tank pit area. Tank removal and excavation activities are documented in the *Report of Underground Storage Tank Replacement Activities* dated September 1990. The product pumping system installed in recovery well (RW-1) to remove separate-phase product from the water table began operation on January 19, 1993. A system to extract and treat soil vapor began full-scale operation on June 1, 1993.

The SVE system consists of seven horizontal vapor extraction lines and a vapor treatment system consisting of a Padre™ regenerative adsorption system manufactured by Purus, Inc., followed by a granular activated carbon (GAC) polish. Figure 3 depicts the layout of the vapor extraction lines and the vapor treatment system. A detailed description of the SVE system can be found in the report entitled *Quarterly Groundwater Monitoring and Soil Vapor Extraction Report* dated October 1, 1993. Prior to June 30, 1993, the SVE system startup and operation was conducted in accordance with the Bay Area Air Quality Management District (BAAQMD) Authority to Construct Permit dated March 4, 1993. System operation since June 30, 1993 has been conducted in accordance with the Permit to Operate dated June 30, 1993 and amended October 20, 1994, to modify the monitoring schedule to monthly.

3.0 SCOPE OF WORK

Work conducted during this quarter consisted of the monitoring of 12 groundwater monitoring wells and the sampling of ten groundwater monitoring wells. The following sections provide a description of the work steps conducted.

3.1 Soil Vapor Extraction System

The SVE system has not operated since November 24, 1994, due to a system fault. In addition, the system was down when PVC piping was damaged during the installation of UST cathodic protection. The SVE piping was repaired in December 1994; however, the system remains non-operational pending modification to a carbon adsorption treatment system. Operation of the SVE system will be resumed as soon as the system modification is complete.

3.2 RW-1 Mineral Spirits Recovery

The mineral spirits recovery skimming pump began operation on January 19, 1993. Mineral spirits recovered from well RW-1 (Figure 2) is pumped directly to the waste mineral spirits tank operated at the site and is incorporated into the Safety-Kleen recycling process.

3.3 Groundwater Monitoring and Sampling

On April 10, 1995, on- and off-site monitoring wells were monitored for depth-to-water using a water level indicator calibrated to 0.01-foot. Monitoring well MW-10 was not monitored due to access being restricted by Caltrans by the presence of a fence located around property north of Fifth Street (Figure 2). The depth-to-water measurements were used with well survey data to construct a potentiometric surface map (Figure 4).

On April 10 and 11, 1995, subsequent to collecting depth-to-water measurements, monitoring wells MW-6, MW-8, and MW-11 through MW-13 (in accordance with the quarterly sampling schedule) were purged by hand bailing until approximately three well volumes of groundwater had been removed, or until measurements of pH, temperature, and conductivity had stabilized. Following recovery of the groundwater levels in the wells, groundwater samples were collected using disposable samplers. The groundwater samples were placed into laboratory supplied sample containers. Field data sheets which include depth-to-water measurements and well purge data are included in Appendix A.

many other wells sampled also .
? hub?

The groundwater samples were labeled, placed on ice, and delivered to a state-certified laboratory for analysis under chain-of-custody documentation. The groundwater samples were analyzed for the presence of benzene, toluene, ethylbenzene and xylenes (BTEX) by U.S. Environmental Protection Agency (EPA) Method 8020, for total petroleum hydrocarbons as mineral spirits (TPHms) by modified EPA Method 8015 and for halogenated volatile organic compounds (VOCs) by EPA Method 8010.

Prior to using any equipment in a groundwater monitoring well, the equipment was decontaminated by double-washing with a laboratory grade detergent in clean water, and triple-rinsed using deionized water. Purge water and decontamination water generated during well purging and sampling was placed in the waste mineral spirits tank or in labeled containers pending proper disposal.

4.0 RESULTS

4.1 Soil Vapor Extraction System

No samples were collected or analyzed from the soil vapor extraction system during this reporting period because the system was non-operational.

4.2 RW-1 Mineral Spirits Recovery

The mineral spirits skimming pump recovery data was calculated to be 16.6 gallons during this reporting period. A total of 125.5 gallons of product have been removed since the pump was installed on January 19, 1993. Product recovery data are summarized on Table 1.

4.3 Groundwater Elevations

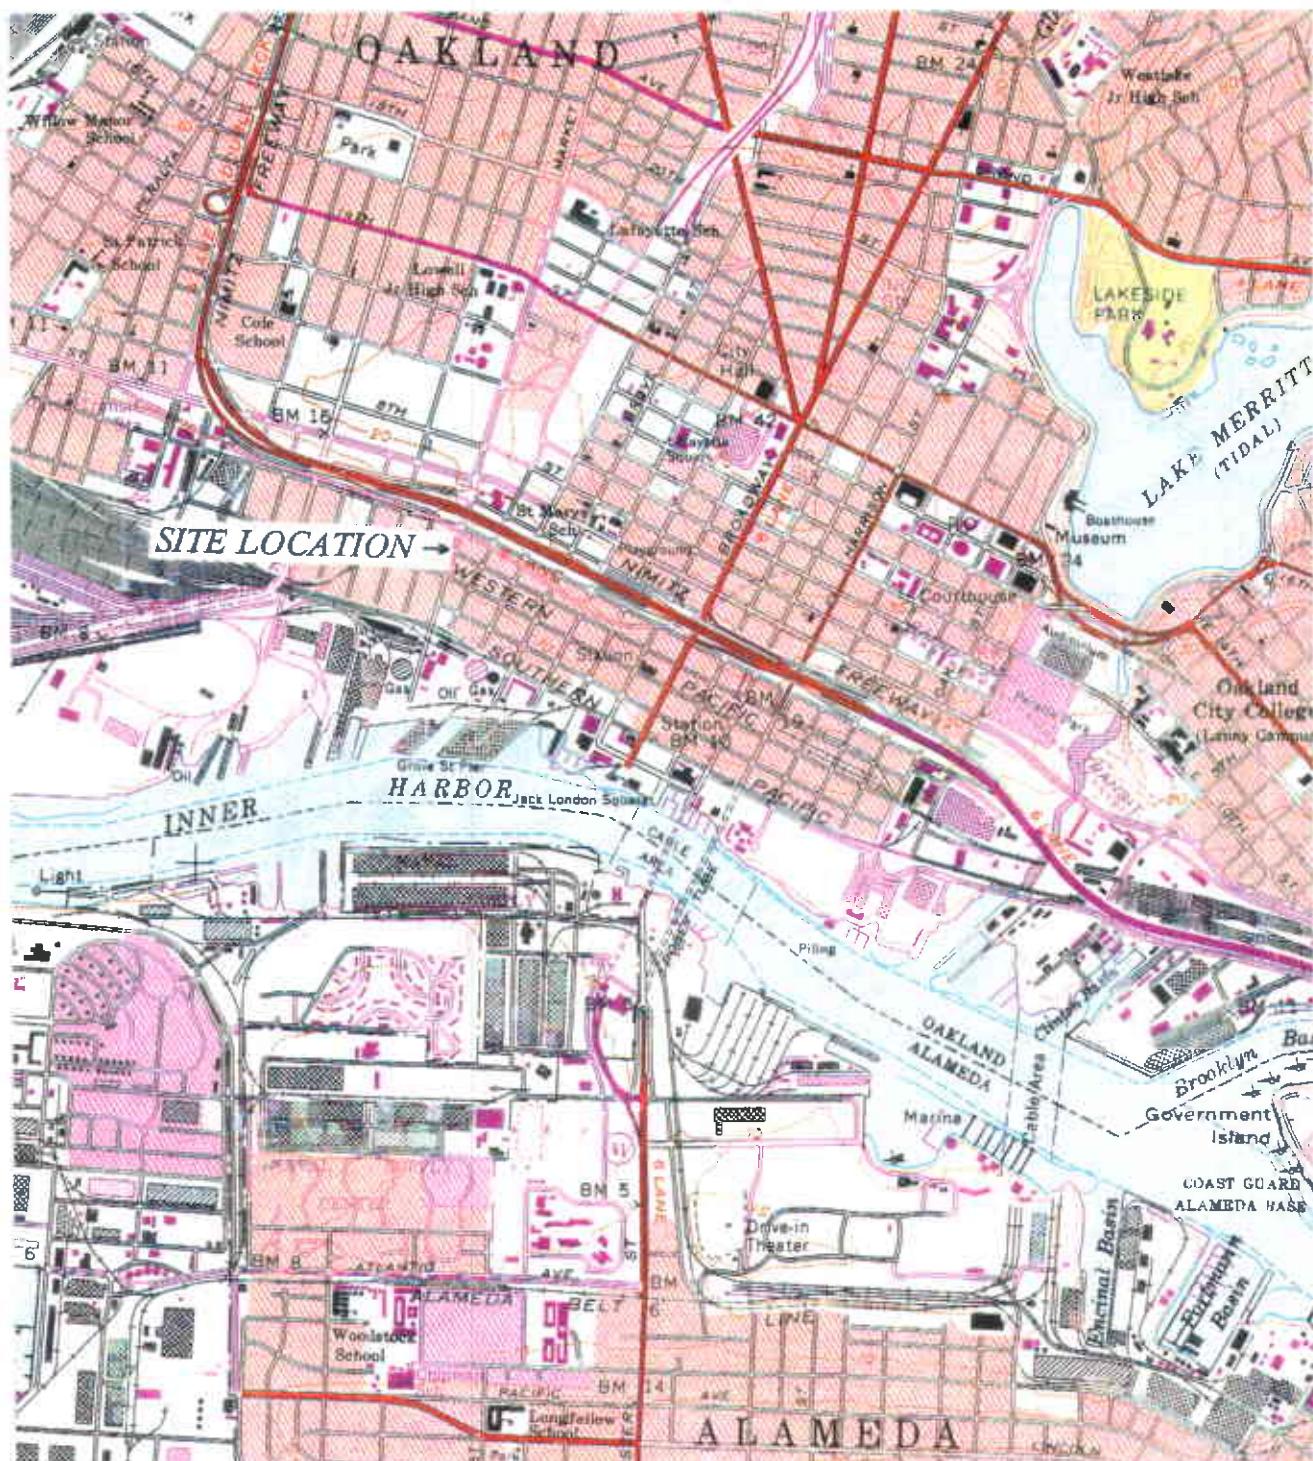

Groundwater elevations and depth-to-water readings as measured on April 10, 1995, are presented in Table 2. The average water table elevation increased by an average of 1.03 feet since the January 4, 1995, monitoring and sampling event. A potentiometric surface map prepared with the April 10, 1995, data is presented as Figure 4.

The groundwater flow direction remains to the southwest, consistent with historic site data. The hydraulic gradient is an average of 0.005 feet/foot (ft/ft) across the site and is similar to the previous quarter's data and is typical for the site.

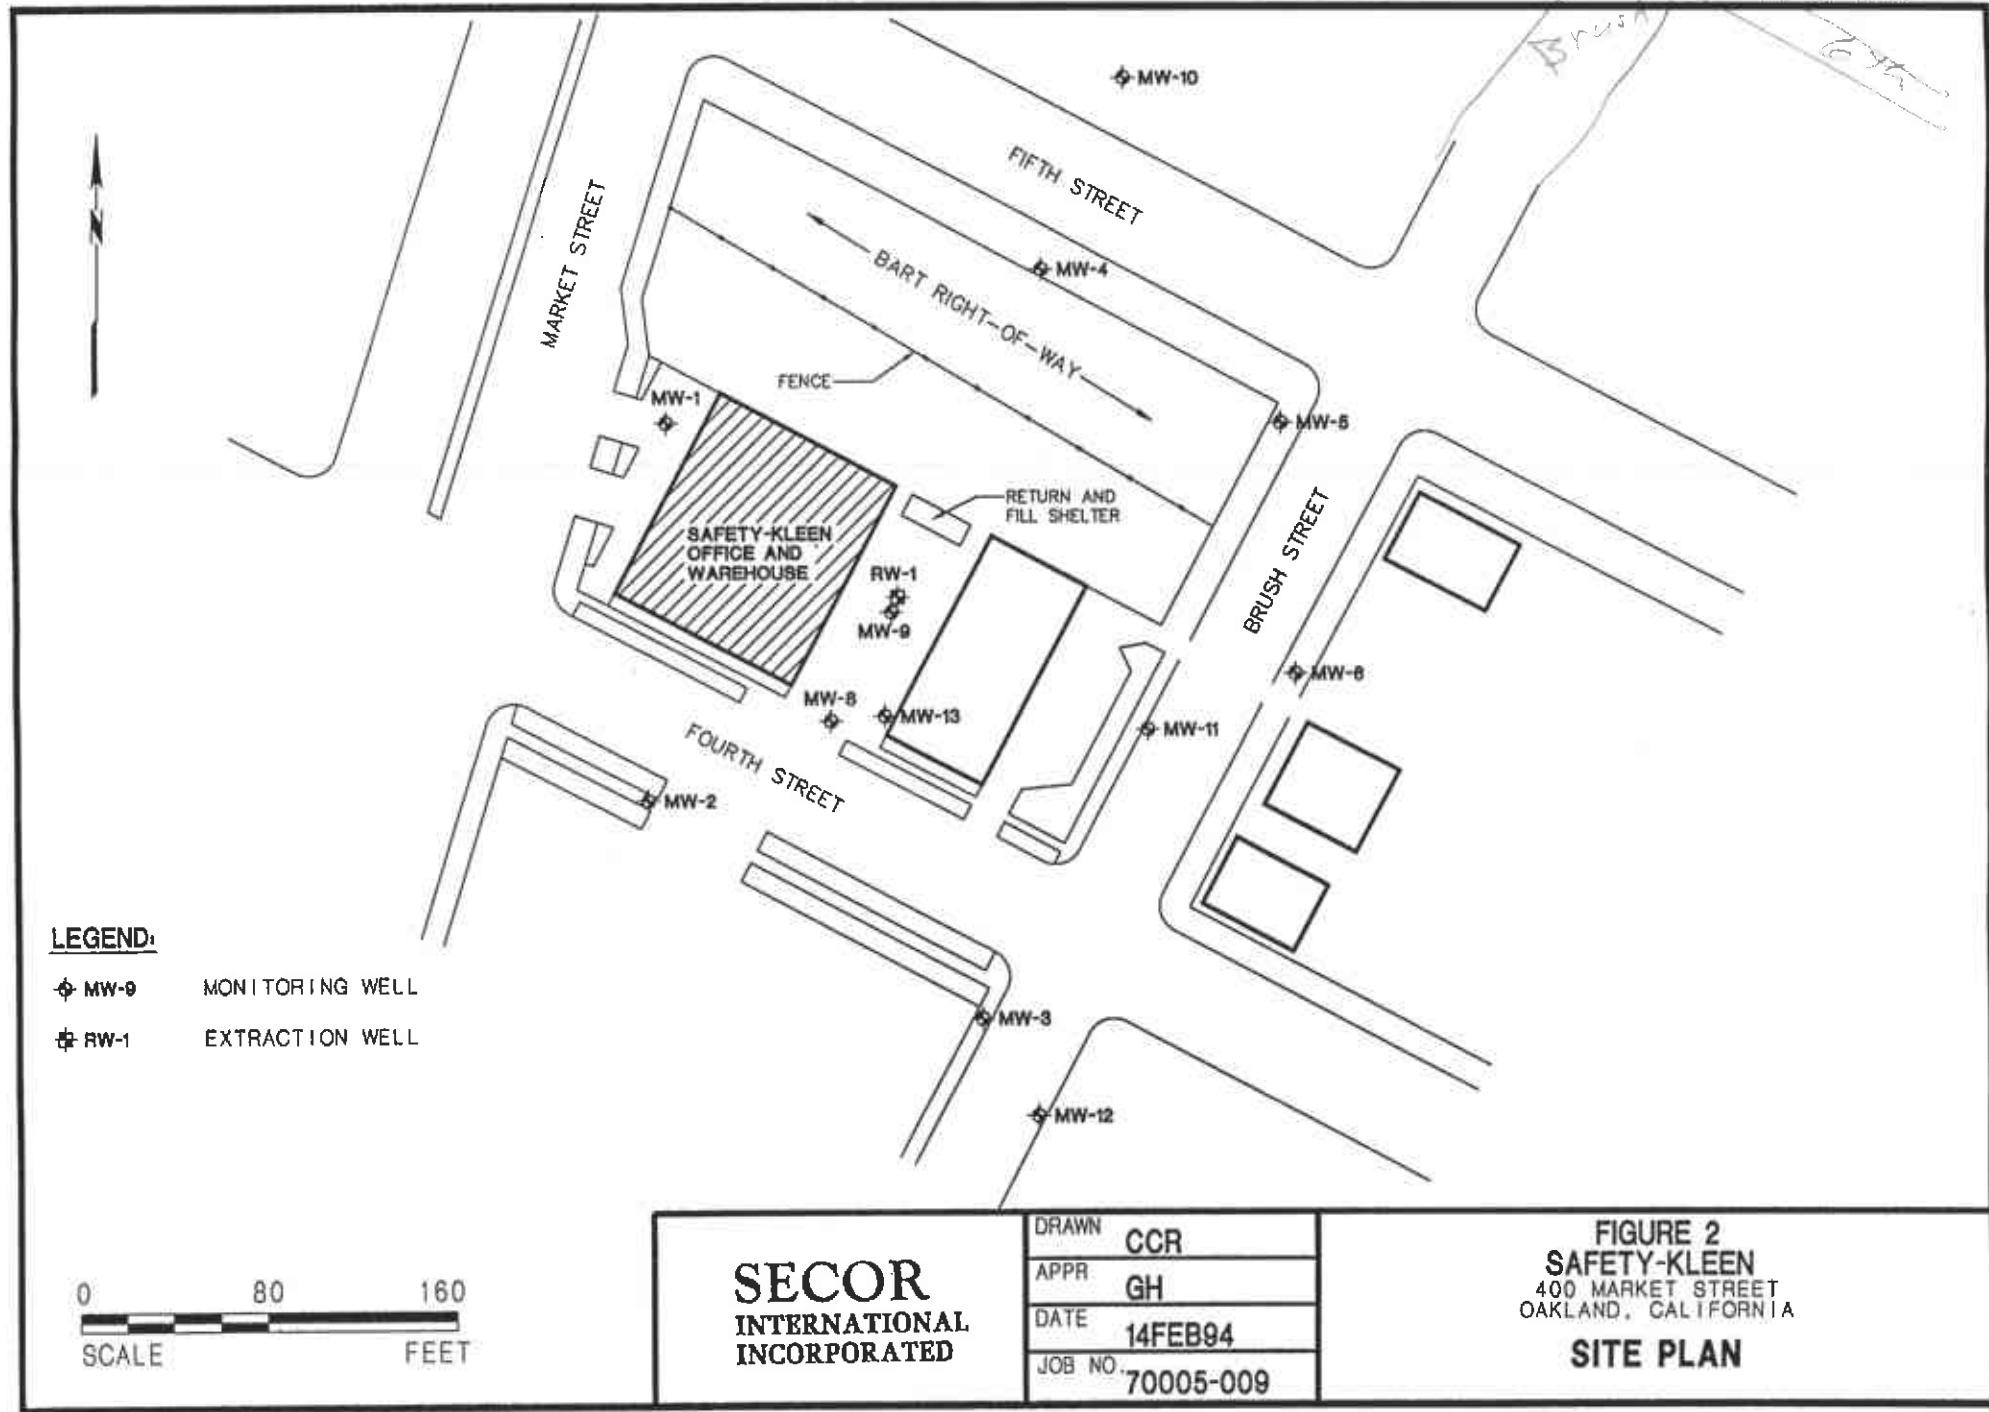

4.4 Groundwater Conditions

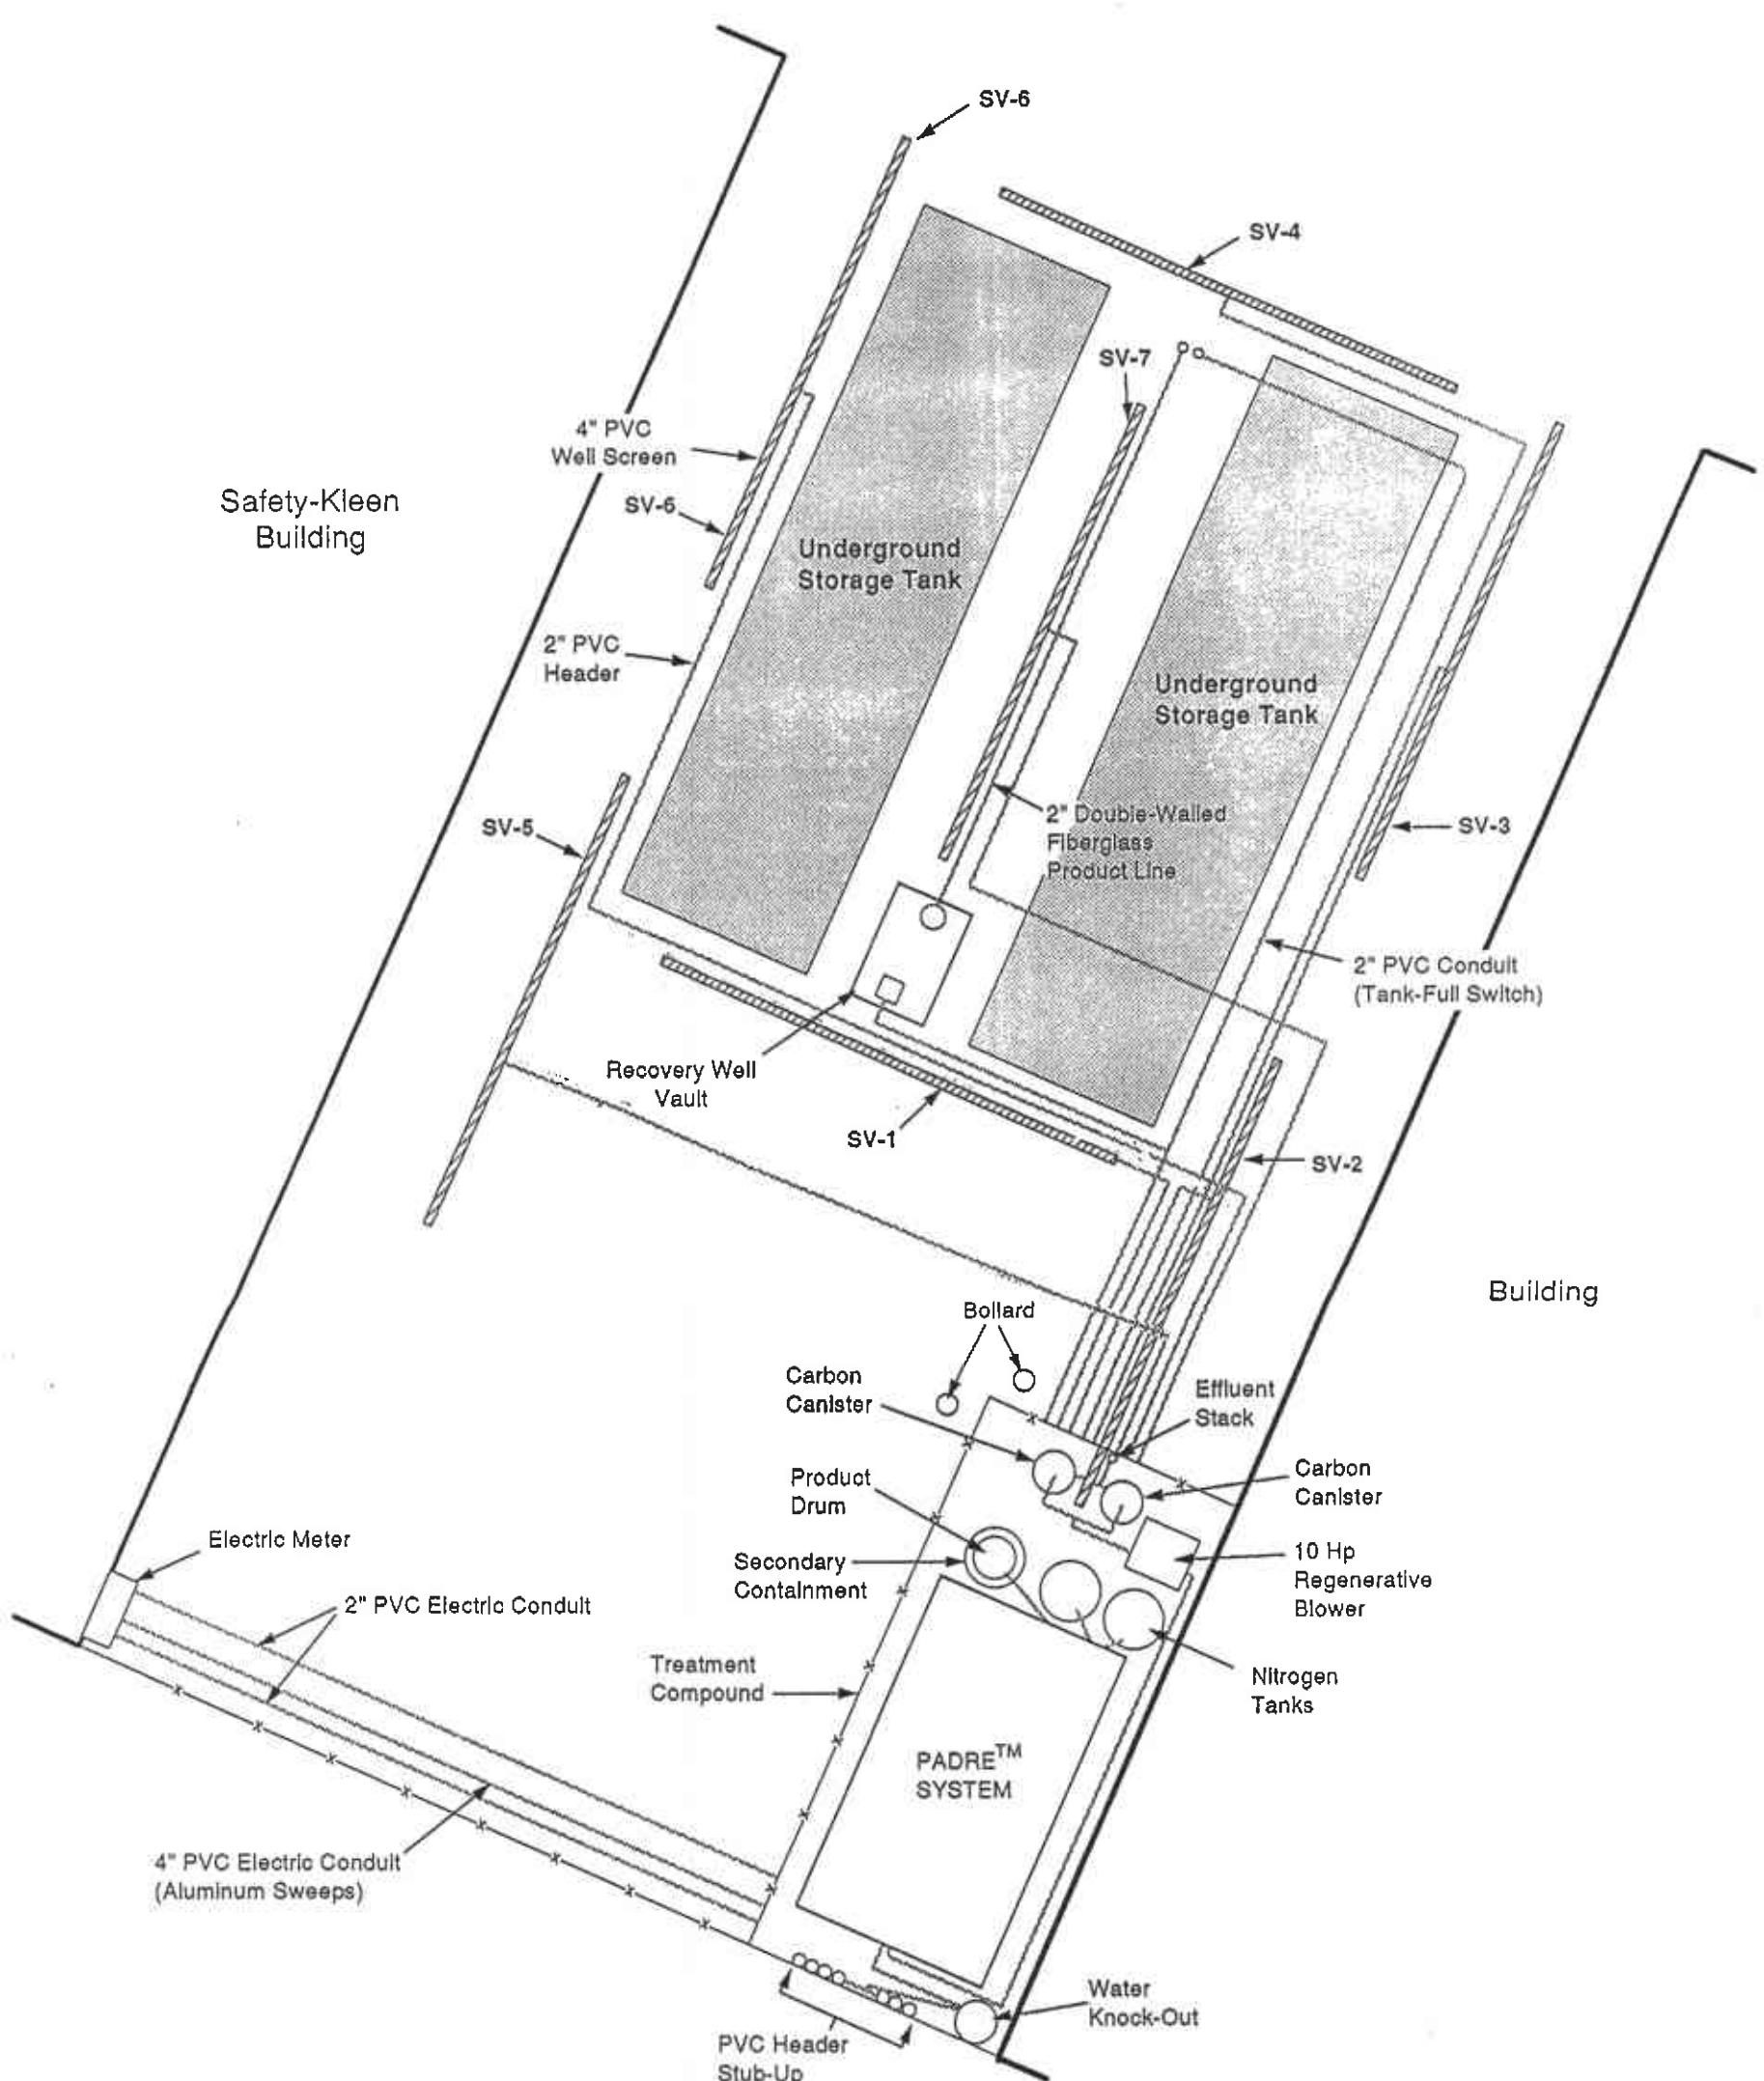

With the exception of a toluene concentration of $1.2 \mu\text{g/l}$ detected in the samples from monitoring well MW-4, no concentrations of BTEX were detected above the laboratory detection limits in any of the groundwater samples collected on April 10 and 11, 1995. The groundwater sample from monitoring well MW-1 contained a PCE concentration of $0.7 \mu\text{g/l}$. The groundwater sample from monitoring well MW-4 contained the following non-BTEX VOC concentrations: 1,1-DCE at $0.8 \mu\text{g/l}$; trans-1,2-DCE at $1 \mu\text{g/l}$; TCE at $440 \mu\text{g/l}$; vinyl chloride at $2 \mu\text{g/l}$; and dichlorodifluoromethane (DCF) at $2 \mu\text{g/l}$. The groundwater sample from monitoring well MW-5 contained TCE at $9.1 \mu\text{g/l}$ and trichlorofluoromethane (TCFM) at $16 \mu\text{g/l}$. The groundwater sample from monitoring well MW-6 contained a TCE concentration of $0.4 \mu\text{g/l}$. The groundwater sample from monitoring well MW-8 contained 1,1-DCA at $0.6 \mu\text{g/l}$, TCE at $15 \mu\text{g/l}$, and PCE at $0.4 \mu\text{g/l}$. The groundwater sample from monitoring well MW-11 contained TCE at $3.4 \mu\text{g/l}$ and TCFM at $1.4 \mu\text{g/l}$. The groundwater sample from monitoring well MW-12 contained 1,1-DCA at $3.8 \mu\text{g/l}$ and TCE at $59 \mu\text{g/l}$. Analytical test results showing compounds detected since the April 20, 1993 sampling event are presented in Table 3. Copies of the groundwater laboratory analytical reports are included in Appendix B.

TPHms = total petroleum hydrocarbons as mineral spirits
 B = Benzene
 T = Toluene
 E = Ethylbenzene
 X = Xylenes

DCE = Dichloroethene
 DCA = Dichloroethane
 TCA = Trichloroethane
 TCE = Trichloroethene
 PCE = Tetrachloroethene
 CB = Chlorobenzene
 DCP = Dichloropropane
 DCB = Dichlorobenzene
 TCFM = Trichlorofluoroethane
 MCL = Maximum contaminant level for primary drinking water constituents

NE = Not Established
 NS = Not Sampled
 - = Not Detected

NOTES:

Only compounds detected in one or more samples are included. See the laboratory reports for a complete list of analytes.

* The TPH as mineral spirits result is the result of an unknown hydrocarbon consisting of a single peak.

KEY TO ABBREVIATIONS and METHOD REFERENCES

- < : Less than; When appearing in results column indicates analyte not detected at the value following. This datum supercedes the listed Reporting Limit.
- * : Reporting Limits are a function of the dilution factor for any given sample. To obtain the actual reporting limits for this sample, multiply the stated Reporting Limits by the dilution factor (but do not multiply reported values).
- ICVS : Initial Calibration Verification Standard (External Standard).
- mean : Average; sum of measurements divided by number of measurements.
- mg/Kg (ppm) : Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).
- mg/L : Concentration in units of milligrams of analyte per liter of sample.
- mL/L/hr : Milliliters per liter per hour.
- MPN/100 mL : Most probable number of bacteria per one hundred milliliters of sample.
- N/A : Not applicable.
- NA : Not analyzed.
- ND : Not detected; the analyte concentration is less than applicable listed reporting limit.
- NTU : Nephelometric turbidity units.
- RPD : Relative percent difference, $100 \{Value\ 1 - Value\ 2\} / mean\ value$.
- SNA : Standard not available.
- ug/Kg (ppb) : Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).
- ug/L : Concentration in units of micrograms of analyte per liter of sample.
- umhos/cm : Micromhos per centimeter.
