RE: Former Exxon RAS #7-0238/2200 East 12th Street, Oakland, California.

Dear Mr. Chan:

Attached for your review and comment is a letter report entitled *Dual-Phase Extraction Feasibility Test Report and Conceptual Corrective Action Plan*, dated September 19, 2001, for the above referenced site. The report was prepared by Environmental Resolutions, Inc. (ERI) of Novato, California, and details the results of the dual-phase extraction test procedures performed at the subject site.

If you have any questions or comments, please contact me at (925) 246-8747.

Sincerely,

Gene N. Ortega
Territory Manager

For ExxonMobil Refining and Supply

1.0 INTRODUCTION

At the request of ExxonMobil Refining and Supply (formerly Exxon Company, U.S.A.) (ExxonMobil), Environmental Resolutions, Inc. (ERI) conducted a dual-phase extraction (DPE) feasibility test at former Exxon Service Station 7-0238, in Oakland, California. The purpose of the test was to evaluate the effectiveness of DPE as a remedial alternative for this site. To facilitate the test, ERI installed two vapor points, VP1 and VP2. This report documents the methods and results of the investigation. Also included is ERI's Conceptual Corrective Action Plan describing planned groundwater and soil vapor extraction and treatment at the site.

1.1 Setting

The site is located on the southwestern corner of East 12th Street and 22nd Avenue in Oakland, California, as shown on the Site Vicinity Map (Plate 1). The locations of the underground storage tanks (USTs), dispenser islands, groundwater monitoring wells, and other select site features are shown on the Generalized Site Plan (Plate 2).

According to information provided by ExxonMobil, Texaco operated a service station at this site until 1988. In October 1988, ownership of the station transferred from Texaco to ExxonMobil.

ExxonMobil operated a service station at the site from 1988 to 2000. In June 2000, ExxonMobil transferred the ownership of the station to Valero Refining Company, which continues ownership and operation.

2.0 CHRONOLOGY OF ENVIRONMENTAL INVESTIGATION

The following summarizes specific site assessment events and remedial efforts at the site.

- May 1988 – Texaco began environmental activities at the site, including a sensitive receptor survey (SRS), and a preliminary subsurface investigation.
- June 1988 – Texaco installed three groundwater monitoring wells, MWA through MW9C, and began quarterly monitoring and sampling of the wells.
- September 1988 – Texaco conducted a soil gas survey.
- October 1988 – Texaco installed two groundwater monitoring wells, MW9D and MW9E.
- November 1988 – Texaco installed three groundwater monitoring wells, MW9F through MW9H.
- February 1989 – Texaco performed a slug tests on two on-site wells. The hydraulic conductivity was reported to be 0.4 to 0.5 ft/day.
- Third quarter 1989– Texaco submitted a *Site Assessment Report*.
- Fourth quarter 1990 – Texaco excavated hydrocarbon-impacted soil from between the product dispensers and the sidewalk. Groundwater monitoring well MW9E was destroyed during the excavation. Groundwater monitoring well MW9I was installed to replace well MW9E.
- 1991 – ExxonMobil removed two 10,000-gallon USTs and one 7,500-gallon UST, and the product piping. The USTs were constructed of single-wall steel; no holes or breaches were reported in the USTs during removal. The USTs were replaced with three 12,000-gallon double-wall fiberglass USTs. The product lines were replaced with double-wall fiberglass lines.
- August 1995 – Texaco submitted a *Management Plan and Work Plan for Non-Attainment Area Closure*.
- April 1996 – Texaco submitted a *Utility Trench Investigation Report*. The report concluded that the utility trenches in the vicinity of the site are not acting as preferential pathways for plume migration.
- June 1996 – Texaco recommended that the site be closed as a Low Risk Groundwater Case.
- July 1996 – Texaco submitted an *Offsite Source Report*.
- September 1996 – Texaco began annual sampling of groundwater monitoring wells and pursued case closure based on decrease in benzene concentrations detected in groundwater samples.

- September 1997 – ExxonMobil removed one 550-gallon used-oil UST.
- June 1999 – ExxonMobil submitted a *Report of Findings*, detailing hydraulic gradient and groundwater flow direction at the site and utility line depths. Based on the depth of the utilities it does not appear that they are acting as preferential pathways for plume migration.
- September 1999 – ExxonMobil submitted a *Report of Tank and Line Testing*. The report stated that the UST system is monitored by a leak detection system, and that the USTs had not failed any tests since the leak detection system had been installed.
- February 2000 – ExxonMobil performed an SRS.
- April 2000 – ExxonMobil sold the property including the UST system to Valero Refining Company.
- January 2001 - ExxonMobil installed two vapor point wells (VP1 and VP2).
- March 2001 – ExxonMobil performed a DPE feasibility test.

2.1 Background

There are eight groundwater monitoring wells (MW9A through MW9D, and MW9F through MW9I), and two vapor points (VP1 and VP2) on and in the vicinity of the site as shown on Plate 2. Well construction logs are included in Appendix A.

Analyses of groundwater samples collected from the monitoring wells have detected total petroleum hydrocarbons as gasoline (TPHg), total petroleum hydrocarbons as diesel (TPHd), benzene, toluene, ethylbenzene, and total xylenes (BTEX), and methyl tertiary butyl ether (MTBE). Cumulative groundwater monitoring and sampling data are summarized in Table 1.

2.2 Site Geology and Hydrogeology

Based on boring log data, the west side of the site is underlain by up to 16 feet of clay, as shown in boring logs for wells MW9H and MW9F. From the center of the site near well MW9C eastward, is approximately 7 feet of clay overlying up to 10 feet of sand.

Based on quarterly groundwater monitoring data collected since 1995, the depth to groundwater (DTW) across the site has fluctuated from approximately 4 to 9 feet below ground surface (bgs). Groundwater flows persistently towards the west with a hydraulic gradient ranging from 0.010 to 0.028. A Groundwater Rose Diagram depicting groundwater flow directions is shown on Plate 3.

3.0 DUAL-PHASE EXTRACTION FEASIBILITY TEST

3.1 Purpose and Scope of Work

ERI performed the DPE feasibility test in accordance with ERI's *Work Plan for Dual-Phase Extraction Pilot Test* (ERI, October 2, 2000). The test was performed to evaluate the effectiveness of DPE as a remedial alternative for petroleum hydrocarbon-impacted soil, and dissolved petroleum hydrocarbons, and migration control of the dissolved petroleum hydrocarbon plume. As part of the test, two vapor points (VP1 and VP2) were installed at distances of 10 and 20 feet from the proposed DPE extraction well (MW9B). The focus of the DPE test was to evaluate subsurface characteristics with respect to groundwater drawdown, soil vapor movement, groundwater capture zone, radius of influence (ROI), and petroleum hydrocarbon removal rates.

3.2 Vapor Point Installation

ERI performed the vapor point installations in accordance with ERI's standard field protocol (Appendix B), a site-specific Health and Safety Plan, and the Work Plan. Prior to drilling, ERI obtained well installation permits from the County of Alameda Public Works Agency (the County). Copies of the permits are provided in Appendix C.

On January 11, 2001, an ERI geologist observed Gregg Drilling and Testing, Inc. (Gregg) of Martinez, California, install two on-site vapor points (VP1 and VP2) using a hollow-stem auger drilling rig. The borings for VP1 and VP2 were each advanced to approximately 20 feet bgs. Groundwater was not encountered in the two borings. Boring logs are provided in Appendix A. Soil generated during drilling was contained on site in 55-gallon steel drums.

Select soil samples collected from borings VP1 and VP2 were submitted to Southern Petroleum Laboratories, Inc. (SPL), a California state-certified laboratory, under Chain-of-Custody protocol. The samples were analyzed for TPHg, BTEX, and MTBE using the methods listed in Table 2. The results of laboratory analyses of soil samples are presented in Table 2. The laboratory analysis report and Chain-of-Custody record are attached (Appendix D).

On March 13, 2001, Dillard Environmental Services (Dillard) of Byron, California, under direct contract to ExxonMobil, transported three 55-gallon drums of soil generated during the well installation

to the Republic-Vasco landfill in Livermore, California. Soil disposal documentation is included as Appendix E.

3.3 Equipment

ERI performed the DPE test using a trailer-mounted DPE unit equipped with two 5-horsepower liquid-ring pumps (LRPs). Two 500-pound vapor-phase carbon adsorbers connected in series provided vapor abatement. Groundwater was removed from the vapor stream by a moisture separator, treated with two 1000-pound liquid-phase carbon vessels and discharged into the storm sewer in accordance with National Pollutant Discharge Elimination System (NPDES) Permit No. CAG912002. Dwyer® magnehelic gauges were used to measure vacuum in the observation wells in inches of water column. A Thermo Environmental Instruments model 580B photoionization detector (PID) measured hydrocarbon concentrations in the field. Tedlar® sample bags were used to collect air samples for laboratory analysis. A Solinst® electronic sounder was used to measure water levels. InSitu, Inc. MiniTroll Pro® pressure transducer/data loggers were used to record water levels.

3.4 Dual-Phase Extraction Test Format

ERI performed the DPE feasibility test on March 12 through 16, 2001. Well MW9B was used as the extraction well, and vacuum was applied using the LRPs. Observation wells included VP1, VP2, and MW9I. The initial test, performed using well MW9B, lasted 42.5 hours. ERI then performed extraction from VP1 for 3 hours to further investigate the radius of influence (ROI). Finally, ERI performed source removal from well MW9I for a period of 45 hours, the last 22 hours of which included well MW9B.

While applying vacuum to well MW9B, ERI monitored induced vacuum and groundwater drawdown in wells VP1, VP2, and MW9I. Pressure transducer/data logger data are provided in Appendix F. While extracting from VP1, ERI monitored induced vacuum in wells VP2, MW9B, and MW9I. While extracting from both MW9B and MW9I, no observation wells were used. Applied vacuum, vapor flow rate, temperature, pressure, groundwater extraction rate, and influent concentrations were monitored at the extraction unit. PID readings were recorded at the influent sample port periodically throughout the test. Influent and effluent groundwater samples were collected for laboratory analysis at the beginning and ending of the test.

Based on effluent groundwater analytical laboratory results, ERI subsequently scheduled an additional treatment and sampling event. On March 23, 2001, ERI personnel purged and treated approximately 60 gallons of groundwater prior to collecting effluent samples for laboratory testing. Analytical laboratory results of water samples are presented in Tables 3, 4, and 5, respectively. Influent soil vapor samples were periodically collected during the test for laboratory analysis. Soil vapor sample results are presented in Table 6. Laboratory analysis reports and Chain-of-Custody records for soil vapor and water samples collected during the DPE test are provided in Appendix D. Field data recorded during the DPE test are summarized in Tables 7 and 8.

3.5 Dual-Phase Extraction Test Interpretation

ERI applied a "best-fit" line to plots of maximum induced vacuum versus distance from the extraction well to evaluate the effective ROI. Using 0.5 inch of water (vacuum) as the basis for an effective ROI, the estimated effective vacuum ROI for DPE is approximately 30 feet, as shown on Graph 1 and Plate 4.

Using ERI's standard of operating procedure (SOP) 25 "Hydrocarbon Removal From a Vadose Well" (Appendix G), it is estimated that approximately 55.70 pounds of TPHg and 1.89 pounds of MTBE were removed by DPE during the feasibility test. Hydrocarbon removal data are presented in Table 9.

During the DPE test, groundwater drawdown was observed in VP1 at 2.103 feet, VP2 at 1.75 feet, and MW9I at 0.451 feet. Plots of groundwater drawdown on a linear scale versus time for wells MW9I, VP1, and VP2 are shown on Graphs 2 through 4. ERI analyzed the groundwater drawdown data collected from these observation wells using the computer program Aqtesolv™ (Hydro Solve, Inc., 1999). Aqtesolv™ combines statistical parameter estimation methods with graphical curve-matching techniques to analyze the aquifer test data. Transmissivity and storativity estimates were calculated within Aqtesolv™ using the Neuman equation for an unconfined aquifer. The results from the test yielded a transmissivity of 157.7 gallons per foot per day (g/d/ft), a hydraulic conductivity of 15.28 gallons per day per square foot, a specific yield of 0.006293, and a storativity of 0.0002667. The Aqtesolv™ output files are included as Appendix H.

The hydraulic conductivity value falls within the range of values representative of clayey sands, till, silty sands, and is consistent with the interpreted stratigraphy of this aquifer (Fetter, 1994).

Assuming a sustainable pumping rate of 0.55 gallons per minute (gpm), a formation transmissivity of 157.7 gallons per day per foot, and an average hydraulic gradient of 0.018, ERI estimates the downgradient (minimum) steady-state extent of the capture zone (r) using the following equation:

$$r = Q / 2 \pi T i, \text{ where}$$

r = Capture zone extent (downgradient direction)

Q = Sustainable pumping rate

T = Transmissivity

i = Interpreted hydraulic gradient

The calculation yields a downgradient groundwater capture zone of approximately 44 feet. The lateral limit of the capture zone, normal to the direction of groundwater flow, is approximately 139 feet. The DPE groundwater capture zone is shown on Plate 5.

3.6 Projected Dual-Phase Extraction Removal Rates

Projected removal rates are based on readings collected at the completion of testing on MW9B. Based on an ending flow rate of 17 standard cubic feet per minute (scfm), an induced vacuum of 279 inches of water column, and an ending TPHg concentration of 3,640 mg/m³ in the extracted soil vapor, the daily removal of TPHg by vapor extraction is estimated to be:

$$\frac{24 \text{ hr}}{\text{day}} \times \frac{60 \text{ min}}{\text{hr}} \times \frac{17 \text{ ft}^3}{\text{min}} \times \frac{28.3 \text{ m}^3}{1,000 \text{ ft}^3} \times \frac{3,640 \text{ g}}{1,000 \text{ m}^3} \times \frac{1 \text{ lb}}{454 \text{ g}} = \frac{5.6 \text{ lbs TPH}}{\text{day}}$$

Based on the ending influent MTBE concentration of 50 mg/m³ (the laboratory detection limit for the method used), the amount of MTBE initially removed per day by vapor-phase extraction, using ERI's SOP 25, is estimated to be:

$$\frac{24 \text{ hr}}{\text{day}} \times \frac{60 \text{ min}}{\text{hr}} \times \frac{17 \text{ ft}^3}{\text{min}} \times \frac{28.3 \text{ m}^3}{1,000 \text{ ft}^3} \times \frac{50 \text{ g}}{1,000 \text{ m}^3} \times \frac{1 \text{ lb}}{454 \text{ g}} = \frac{0.08 \text{ lbs MTBE}}{\text{day}}$$

4.0 REMEDIAL ALTERNATIVES

ERI evaluated three remedial alternatives for this CAP: 1) natural attenuation, 2) remediation using groundwater extraction and treatment, 3) remediation using DPE. ERI did not consider remediation by excavation and removal of soil because it fails to address the hydrocarbon and MTBE impact to groundwater. For the purpose of system implementation, ERI has selected the cleanup goals equivalent to asymptotic concentrations measured in groundwater samples and soil vapor samples, at which time ERI recommends performing a risk based corrective action (RBCA) in accordance with methods outlined in American Society of Testing Materials (ASTM) E 1739-95. OK

4.1 Natural Attenuation

Natural attenuation is the degradation of petroleum hydrocarbons by naturally occurring biological processes. ERI does not consider natural attenuation an effective remedial alternative at this site because concentrations of petroleum hydrocarbons and MTBE in groundwater are increasing. Natural attenuation was not selected since it appears that remediation goals could be reached in a more timely manner using active remediation.

4.2 Groundwater Extraction and Treatment

The groundwater extraction and treatment system evaluated by ERI involves discharge impacted groundwater, treatment with liquid-phase carbon adsorbers, and extraction of it into the storm sewer under a National Pollutant Discharge Elimination System (NPDES) permit. It is a proven method to remediate groundwater and to control plume migration. The groundwater capture zone and extraction rates produced by DPE included in this CAP indicate that groundwater extraction via pumping alone is not an effective technology for groundwater remediation at this site.

4.3 Dual-Phase Extraction

DPE uses a LRP to provide vacuum up to 394 inches of water, vapor flow-rates up to 250 cfm, and water flow-rates up to 50 gallons per minute (gpm). DPE has an advantage over vapor extraction systems because it depresses the water table, exposing more of the vadose zone to vapor extraction. The high vacuum created by DPE also effectively increases the hydraulic gradient into the extraction well, which increases water removal rates.

5.0 PROPOSED CORRECTIVE ACTION

ERI recommends the installation of a DPE remediation system. The proposed remediation system is intended to provide treatment of dissolved hydrocarbons and oxygenates in groundwater, and residual hydrocarbons and oxygenates in soil.

5.1 Conceptual Remediation System Design

The remediation system will consist of four DPE wells connected to an LRP and associated piping and controls. The extracted vapor will be abated with a catalytic oxidizer, and extracted groundwater will be treated with pre-filters and granular activated carbon. The remediation system will require installation of four DPE wells. Proposed well installation activities are presented below. Final system design and equipment specifications will be included in the remediation design package (RDP), to be submitted at a later date.

5.1-A DPE Well Installation

The approximate locations of proposed dual-phase extraction wells DPE1 through DPE4 are shown on Plate 6.

Field work will be performed in accordance with ERI's standard field protocol and ERI's site-specific Health and Safety Plan.

Upon receipt of the approved well destruction permit, ERI will observe overdrilling and removal of monitoring wells MW9B, MW9C, and MW9I with a hollow-stem auger drilling rig. Following well destruction, three new DPE wells will be installed in the over-drilled borings. The DPE wells will be identified as DPE2, DPE3, and DPE4. ERI will observe the installation of new well casing in three of the borings (DPE2, DPE3, and DPE4) which will require deepening of the existing bore holes. One well (DPE2) will require sealing with bentonite from approximately 17 to 21 feet. The new wells (DPE1, DPE2, DPE3, and DPE4) will be constructed as 4-inch extraction wells screened with continuous wrap PVC well casing from approximately 5 to 20 feet bgs. A typical construction diagram of a DPE well is provided on Plate 7.

ERI will perform the following tasks:

Public Works

- Prepare and obtain a permit from the Alameda County ~~Department of Health Services~~ (the County), to over-drill the existing monitoring wells;
- Observe drilling of one on-site soil boring (DPE1) utilizing a hollow-stem auger drilling rig, and installation of a well in the boring. The boring will be drilled to approximately 20 feet bgs. The boring will be completed as a 4-inch extraction well screened with continuous-wrap well casing from approximately 5-20 feet bgs; *ensure GW is encountered.*
- Observe the over-drilling and removal of three on-site monitoring wells (MW9B, MW9C, and MW9I); *DPE1 ?*
- Observe the installation of new well casing in the over-drilled borings (DPE2, DPE3, and DPE4). The new wells will be constructed using 4-inch well screen with continuous wrap, PVC well casing from approximately 5 to 20 feet bgs;
- Collect soil samples from the borings at 5-foot intervals, note obvious changes in soil type as identified by the field geologist at the time of drilling, and at the capillary fringe to evaluate soil stratigraphy;
- Develop the wells at least 24 hours after installation;
- Collect rinsate and development water, and process through the groundwater remediation system;
- Contract with a licensed land surveyor to survey the location and casing elevation (mean sea level) of the newly installed wells;
- Submit select soil samples under Chain-of-Custody protocol to a California state-certified laboratory for analysis of TPHg, BTEX, and fuel oxygenates (including MTBE). Groundwater samples will be analyzed according to the current groundwater sampling analytical suite for this site; *is this repetitive for soil samples?*
- Store drill cuttings on site pending characterization and disposal. ERI will collect a composite soil sample for laboratory analysis to evaluate disposal options. Upon receipt of analytical results, ERI will coordinate the removal, transport, and disposal of the soil to an appropriate disposal facility selected by ExxonMobil.
- Interpret field and laboratory data to evaluate soil and groundwater conditions and prepare a report summarizing field data and results of laboratory analyses.

The newly installed wells will be sampled during the next scheduled quarterly sampling event and included in future quarterly sampling events. Groundwater samples will be analyzed according to the current groundwater sampling analytical suite for this site.

6.0 SUMMARY

Based on the data collected in the field during the test periods and analytical laboratory results, ERI concludes:

- A total of approximately 55.70 pounds of TPHg and 1.89 pounds of MTBE were removed during the DPE feasibility test.
- Applying a "best-fit" line to plots of induced vacuum versus distance as shown on Graph 1 yields an effective vacuum ROI of approximately 30 feet (Plate 4) for DPE.
- Sustaining a flow rate of 0.55 gpm, DPE yields a calculated capture zone in the downgradient direction of 44 feet with a lateral extent of 139 feet (Plate 5).
- The projected initial removal rates for DPE are TPHg at 5.6 pounds per day and MTBE at 0.08 pounds per day.
- Based on the results of the DPE feasibility test, DPE appears to be a viable remedial alternative for petroleum hydrocarbon source removal and hydraulic control of the dissolved hydrocarbon plume at this site. ERI will prepare an RDP using DPE as the remediation technology.

7.0 LIMITATIONS

This report was prepared in accordance with generally accepted standards of environmental practice in California at the time this investigation was performed. This investigation was conducted solely for the purpose of evaluating environmental conditions of the soil and first-encountered groundwater. No soil engineering or geotechnical references are implied or should be inferred. Evaluation of the geologic conditions at the site for the purpose of this investigation is made from a limited number of observation points. Subsurface conditions may vary away from the data points available. Additional work, including further subsurface investigation, can reduce the inherent uncertainties associated with this type of investigation. This report has been prepared for ExxonMobil, and any reliance on this report by third parties shall be at such party's sole risk.

Notes:

- SUBJ = Results of subjective evaluation.
- NLPH = No liquid-phase hydrocarbons present in well.
- TOC = Elevation of top of well casing; relative to mean sea level.
- DTW = Depth to water.
- Elev. = Elevation of groundwater surface; relative to mean sea level.
- TPHg = Total petroleum hydrocarbons as gasoline analyzed using EPA Method 5030/8015 (modified).
- MTBE = Methyl tertiary butyl ether analyzed using EPA Method 8021B.
- BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021B.
- < = Less than the indicated detection limit shown by the laboratory.
- = Not measured or sampled.
- ug/L = Micrograms per Liter.
- a = MTBE confirmed using EPA Method 8260.
- b = Miscalculation in field. Field technician may have inadvertently monitored and sampled the wrong well. Resampled 5/27/99.
- c = Analyte detected in the associated Trip Blank at 0.52 ug/L.
- d = Due to measurement error during initial sampling event, DTW was re-measured on August 17, 2001. No samples were taken.
- e = Well inaccessible due to uncontrollable traffic conditions.

Table 2
Analytical Laboratory Results of Soil Samples
 Former Exxon Service Station 7-0238
 2200 East 12th Street
 Oakland, California
 (Page 1 of 1)

Sample ID	Sampling Date	Time	TPHg <.....mg/Kg.....>	MTBE	B	T	E	X	Lead
SP1-(1-4)-COMP	01/11/01	10:00	< 1	4.3	<0.01	<0.01	<0.01	<0.01	5.06
S-5-VP1	01/11/01	10:00	17	0.26	0.12	0.17	0.047	0.23	---
S-5-VP2	01/11/01	10:00	< 10	1.9	<0.01	<0.01	0.023	0.046	---

Notes:

- SP1-(1-4)-COMP = Soil sampled from stockpile.
- S-5-VP1 = Soil sampled from VP1 at 5 feet.
- mg/Kg = Milligrams per kilogram.
- TPHg. = Total petroleum hydrocarbons as gasoline analyzed using EPA method 5030/8015 (modified).
- BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA method 8021B.
- MTBE = Methyl tertiary butyl ether analyzed using EPA method 8021.
- < = Less than the stated laboratory method detection limit.
- = Not applicable/not analyzed.

TABLE 3
Analytical Laboratory Results of Groundwater Samples
 Former Exxon Service Station 7-0238
 2200 East 12th Street
 Oakland, California
 (Page 1 of 1)

Sample ID	Sampling Date	Time	TPHd <.....>	TPHg	MTBE	Bug/L.....	T	E	X
W-INF	03/12/01	23:30	3,220	3,550	3,990	495	<30	87.6	101

EXPLANATION

N Compass Direction

Rose diagram developed by evaluating the groundwater gradient direction from the quarterly monitoring data. Each circle on the rose diagram represents the number of monitoring events that the gradient plotted in that 22.5 degree sector. For example, five quarterly groundwater gradient directions plotted between west and south 67.5 degrees west. Therefore, the dominant groundwater gradient direction as depicted by the rose diagram is between west and south 67.5 degrees west.

Data obtained from quarterly groundwater monitoring, first quarter 1998 through first quarter 2001. (thirteen data points)

APPENDIX B
FIELD PROTOCOL

FIELD PROTOCOL

Site Safety Plan

Field work is performed by ERI personnel in accordance with a site safety plan (SSP) developed for the site. The SSP describes the basic safety requirements for the subsurface investigation and the drilling of soil borings at the work site. The SSP is applicable to personnel and subcontractors of ERI. Personnel at the site are informed of the contents of the SSP before work begins. A copy of the SSP is kept at the work site and is available for reference by appropriate parties during the work. The ERI geologist acts as the Site Safety Officer.

Soil Borings and Sampling

Prior to drilling of borings and construction of wells, ERI acquires necessary permits from the appropriate agency(ies). ERI also contacts Underground Service Alert (USA) and a private utility locator before drilling to help locate public utility lines at the site. ERI observes the driller hand-probe and hand-auger boring locations to a depth of approximately 5 feet bgs and a diameter greater than the soil boring diameter before drilling to reduce the risk of damaging underground structures.

Soil borings are drilled with a B-57 (or similar) drill rig equipped with 8-inch diameter, hollow-stem augers. Auger flights and sampling equipment are steam-cleaned before use to minimize the possibility of crosshole contamination. The rinsate is containerized and stored on site. ERI will coordinate with ExxonMobil for appropriate recycling or disposal of the rinsate.

Drilling is performed under the observation of a field geologist, and the earth materials in the borings are identified using visual and manual methods, and classified as drilling progresses using the Unified Soil Classification System. Soil borings are drilled to approximately 10 to 15 feet below the uppermost zone of saturation or 5 feet into any competent clay layer (aquitar) encountered beneath the water-bearing zone. If an aquitar is encountered, the boring is terminated and backfilled with bentonite before installing a groundwater monitoring well.

During drilling, soil samples are collected at 5-foot intervals, obvious changes in lithology, and just above the groundwater surface. Samples are collected with a California-modified, split-spoon sampler equipped with laboratory-cleaned brass sleeves. Samples are collected by advancing the auger to a point just above the sampling depth and driving the sampler into the soil. The sampler is driven 18 inches with a standard 140-pound hammer repeatedly dropped 30 inches. The number of blows required to drive the sampler each successive 6-inch interval is counted and recorded to give an indication of soil consistency.

Soil samples are monitored with a photoionization detector (PID), which measures hydrocarbon concentrations in the ambient air or headspace above the soil sample. Field instruments such as the PID are useful for indicating relative levels of hydrocarbon vapors, but do not detect concentrations of hydrocarbons with the same precision as laboratory analyses. Soil samples selected for possible chemical analyses are sealed promptly with Teflon® tape, and plastic caps. The samples are labeled and placed in iced storage for transport to the laboratory. Chain of Custody Records are initiated by the geologist in the field, updated throughout handling of the samples, and sent with the samples to the laboratory. Copies of these records are in our report. Cuttings generated during drilling are

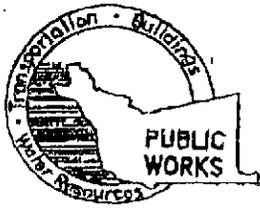

placed on plastic sheeting and covered and left at the site. ERI coordinates with ExxonMobil for the soil to either be treated on site or removed to an appropriate recycling or disposal facility.

Monitoring Well Construction

Monitoring wells are constructed in borings using thread-jointed, 2-inch inner diameter, Schedule 40 polyvinyl chloride (PVC) casing. No chemical cements, glues, or solvents are used in well construction. The screened portion of each well consists of factory-perforated casing with 0.010-inch wide slots. If unconfined aquifer conditions exist, the well screen is installed from the total depth of each well to approximately 10 feet above the uppermost water-bearing unit. If confined conditions exist, the uppermost water-bearing unit is screened exclusively. Unperforated casing is installed from the top of each screen to the ground surface. The annular space in the well is packed with number 2/12 sand to approximately 1 to 2 feet above the slotted interval. A bentonite plug is added above the sand pack to prevent cement from entering the well pack. The remaining annulus is backfilled to grade with a slurry of Portland cement.

The monitoring wells are protected with a traffic-rated steel utility box equipped with a galvanized sheet steel skirt. The box has a watertight seal to protect against surface-water infiltration. The design of this box discourages vandalism and reduces the possibility of accidental disturbance of the well.

ESTIMATED STARTING DATE 1-11-2001
ESTIMATED COMPLETION DATE 1-11-2001

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.

APPLICANT'S SIGNATURE Tom Kelly DATE 1-10-00

PLEASE PRINT NAME Tom Kelly Rev. 6-5-00

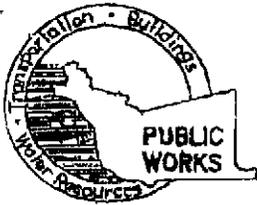

PERMIT CONDITIONS

Circled Permit Requirements Apply

- A. GENERAL
 - 1. A permit application should be submitted so as to arrive at the ACPWA office five days prior to proposed starting date.
 - 2. Submit to ACPWA within 60 days after completion of permitted original Department of Water Resources Well Completion Report.
 - 3. Permit is void if project not begun within 90 days of approval date.
- B. WATER SUPPLY WELLS
 - 1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
 - 2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.
- C. GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS
 - 1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
 - 2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.
- D. GEOTECHNICAL
 - Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings.
- E. CATHODIC
 - Fill hole anode zone with concrete placed by tremie.
- F. WELL DESTRUCTION
 - See attached requirements for destruction of shallow wells. Send a map of work site. A different permit application is required for wells deeper than 45 feet.
- G. SPECIAL CONDITIONS

NOTE: One application must be submitted for each well or well destruction. Multiple borings on one application are acceptable for geotechnical and contamination investigations.

FOR APPLICANT TO COMPLETE

FOR OFFICE USE

LOCATION OF PROJECT Former Exxon Service Station 70238
2200 East 12th Street
Oakland, California

PERMIT NUMBER W01-003
WELL NUMBER _____
APN _____

CLIENT
Name ExxonMobil Refining + Supply
Address P.O. Box 4032 Phone (925) 246-3768
City Coccol, CA Zip 94524-4032

APPLICANT
Name Environmental Resolutions, Inc.
Address 73 Ditch Dr. #100 Phone (415) 982-4825
City Novato, CA Zip 94949

TYPE OF PROJECT
Well Construction Geotechnical Investigation
Cathodic Protection General
Water Supply Contamination
Monitoring Well Destruction

PROPOSED WATER SUPPLY WELL USE
New Domestic Replacement Domestic
Municipal Irrigation
Industrial Other _____

DRILLING METHOD:
Mud Rotary Air Rotary Auger
Cable Other

DRILLER'S NAME Woodward Drilling Co.
DRILLER'S LICENSE NO. 710079

WELL PROJECTS
Drill Hole Diameter 8 in. Maximum _____
Casing Diameter 2 in. Depth 20 ft.
Surface Seal Depth 2 ft. Owner's Well Number VP2

GEOTECHNICAL PROJECTS
Number of Borings _____ Maximum _____
Hole Diameter _____ in. Depth _____ ft.

ESTIMATED STARTING DATE 1-11-2001
ESTIMATED COMPLETION DATE 1-11-2001

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.

APPLICANT'S SIGNATURE Tom Celia DATE 11-10-00

PLEASE PRINT NAME Tom Celia Rev. 6-5-00

PERMIT CONDITIONS Circled Permit Requirements Apply

- A. GENERAL**
 - 1. A permit application should be submitted so as to arrive at the ACPWA office five days prior to proposed starting date.
 - 2. Submit to ACPWA within 60 days after completion of permitted original Department of Water Resources-Well Completion Report.
 - 3. Permit is void if project not begun within 90 days of approval date.
- B. WATER SUPPLY WELLS**
 - 1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
 - 2. Minimum seal depth is 30 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.
- C. GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS**
 - 1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
 - 2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.
- D. GEOTECHNICAL**
Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings.
- E. CATHODIC**
Fill hole anode zone with concrete placed by tremie
- F. WELL DESTRUCTION**
See attached requirements for destruction of shallow wells. Send a map of work site. A different permit application is required for wells deeper than 45 feet.
- G. SPECIAL CONDITIONS**

NOTE: One application must be submitted for each well or well destruction. Multiple borings on one application are acceptable for geotechnical and contamination investigations.

APPROVED [Signature] DATE 1-2-01

APPENDIX D

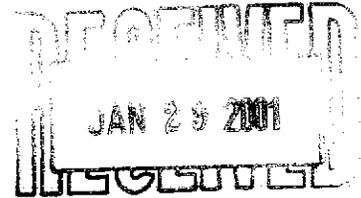

**LABORATORY ANALYSIS REPORTS

ph: (415) 382-9105 fax: (415) 382-1856

Project Name: 229304x
Site: 7-0238,19802889
Site Address: 2200 E 12TH St
Oakland CA
PO Number: LWR#21010401
State: California
State Cert. No.: 1903
Date Reported: 1/23/01

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above Certificate of Analysis Number.

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

Sample Spiked: 01010377-01
 RunID: VARE_010119B-536259 Units: mg/Kg-dry
 Analysis Date: 01/19/2001 16:48 Analyst: TM

Analyte	Sample Result	MS Spike Added	MS Result	MS % Recovery	MSD Spike Added	MSD Result	MSD % Recovery	RPD	RPD Limit	Low Limit	High Limit
Gasoline Range Organics	ND	475	450	94.6	475	510	108	12.8	50	36	163

Qualifiers: ND/U - Not Detected at the Reporting Limit MI - Matrix Interference
 B - Analyte detected in the associated Method Blank D - Recovery Unreportable due to Dilution
 J - Estimated value between MDL and PQL * - Recovery Outside Advisable QC Limits

The percent recoveries for QC samples are correct as reported. Due to significant figures and rounding, the reported RPD may differ from the displayed RPD values but is correct as reported.

Notes and Definitions

- A-01 The spike recovery for this compound is above QC limits.
- C-01 To reduce matrix interference, the sample extract has undergone sulfuric acid clean-up, method 3665, which is specific to hydrocarbon contamination.
- D-08 Results in the diesel organics range are elevated due to overlap from lower boiling point hydrocarbons.
- QM-01 The spike recovery for this QC sample is outside of established control limits due to sample matrix interference.
- QM-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- QR-07 The RPD was outside QC acceptance limits.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

Notes and Definitions

- 15 Chromatogram Pattern: Unidentified Hydrocarbons C9-C24
- 01 Chromatogram Pattern: Gasoline C6-C12
- 01 The spike recovery for this QC sample is outside of established control limits. Review of associated batch QC indicates the recovery for this analyte does not represent an out-of-control condition for the batch.
- M-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- 03 The surrogate recovery for this sample is outside of established control limits. Review of associated QC indicates the recovery for this surrogate does not represent an out-of-control condition.
- DET Analyte DETECTED
- D Analyte NOT DETECTED at or above the reporting limit
- R Not Reported
- ry Sample results reported on a dry weight basis
- PD Relative Percent Difference

Re: MKC0637

Dear Scott Thompson:

Enclosed is the fish bioassay results on the sample submitted on 3/23/01. If there are any questions concerning this report please feel free to contact me.

Sincerely,

Wayne Stevenson
Project Manager

Notes and Definitions

15 Chromatogram Pattern: Unidentified Hydrocarbons C9-C24

01 Chromatogram Pattern: Gasoline C6-C12

01 The spike recovery for this QC sample is outside of established control limits. Review of associated batch QC indicates the recovery for this analyte does not represent an out-of-control condition for the batch.

M-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

03 The surrogate recovery for this sample is outside of established control limits. Review of associated QC indicates the recovery for this surrogate does not represent an out-of-control condition.

--	---

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above Certificate of Analysis Number.

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

No.: 1903 Date Reported: 3/22/01
---	---

Your samples for BTEX & MTBE and TPH on Air was received expired. As per our conversation on March 20, 2001, the laboratory proceeded with the analyses.

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above Certificate of Analysis Number.

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

Date and Time Received:	3/20/01 10:00:00 AM	Carrier name:	FedEx
Temperature:	AMBIENT	Chilled by:	Not Chilled

1. Shipping container/cooler in good condition? Yes No Not Present
2. Custody seals intact on shipping container/cooler? Yes No Not Present
3. Custody seals intact on sample bottles? Yes No Not Present
4. Chain of custody present? Yes No
5. Chain of custody signed when relinquished and received? Yes No
6. Chain of custody agrees with sample labels? Yes No
7. Samples in proper container/bottle? Yes No
8. Sample containers intact? Yes No
9. Sufficient sample volume for indicated test? Yes No
10. All samples received within holding time?
 SAMPLES WERE RECEIVED EXPIRED Yes No
11. Container/Temp Blank temperature in compliance? Yes No
12. Water - VOA vials have zero headspace? Yes No Not Applicable
13. Water - pH acceptable upon receipt? Yes No Not Applicable

In-Situ Inc.		MiniTroll Pro			
Report generated:		12/6/00	10:54:32		
Report from file:		C:\WIN-SITU\Data\SN01046 2000-12-03 160000 Test #1.bin			
DataMgr Version		3.68			
Serial number:		1046			
Firmware Version		2.04			
Unit name:		2293-VP2			
Test name:			Test #1		
Test defined on:		3/12/01	15:33:28		
Test scheduled for:		3/12/01	16:00:00		
Test started on:		3/12/01	16:00:00		
Test stopped on:		3/15/01	10:54:06		
Test extracted on:	N/A				
Data gathered using Linear testing					
Time between data points:	2.0	Minutes.			
Number of data samples:		2008			
TOTAL DATA SAMPLES					
		2008			
Channel number [1]					
Measurement type:		Temperature			
Channel name:		Temperature			
Channel number [2]					
Measurement type:		Pressure			
Channel name:		Pressure			
Sensor Range:		30 PSI.			
Density:			1.000 g/cm3		
Latitude:		38 degrees			
Elevation:		9.144 meters (30.000 feet)

In-Situ Inc.		MiniTroll Pro			
Report generated:		12/6/00	10:14:22		
Report from file:		C:\WIN-SITU\Data\SN01222 2000-12-03 160000 2293w9i.bin			
DataMgr Version		3.68			
Serial number:		1222			
Firmware Version		2.04			
Unit name:		2293-W9I			
Test name:			2293w9i		
Test defined on:		3/12/01	15:27:58		
Test scheduled for:		3/12/01	16:00:00		
Test started on:		3/12/01	16:00:00		
Test stopped on:		3/15/01	9:57:48		
Test extracted on:		N/A			
Data gathered using Linear testing					
Time between data points:	2.0000	Minutes.			
Number of data samples:		1979			
TOTAL DATA SAMPLES		1979			
Channel number [1]					
Measurement type:		Temperature			
Channel name:		Temperature			
Channel number [2]					
Measurement type:		Pressure			
Channel name:		Pressure			
Sensor Range:		30 PSI.			
Specific gravity:		1

APPENDIX G

ERI'S STANDARD OPERATING PROCEDURE 25

"HYDROCARBONS REMOVAL FROM VADOSE WELL"

POUNDS OF HYDROCARBON IN A VAPOR STREAM

INPUT DATA:

- 1) Vapor flow rate acfm (usually by Pitot tube)
- 2) Vapor pressure at the flow measuring device (in inches of H₂O) (use {-} for vacuum)
- 3) Vapor temperature at the flow measuring device.
- 4) Hydrocarbon content of vapor (usually in mg/M³) for ppmv you need molecular weight.
- 5) Length of time (usually hours) over which flow rate occurred)

From periodic measurements, a calculation of total pounds of hydrocarbons removed from a well or from a system are calculated. The input data listed above are measured at a point in time. To calculate quantities removed, some assumptions must be made about what was happening between measurements. The following assumptions will be used for the sake of consistency:

ASSUMPTIONS:

- 1) Vapor flow for the period equals the average of the initial and final reading for the period.
- 2) Pressure and temperature for the entire period will be the final reading.
- 3) Hydrocarbon concentration for the period equals the average of the initial and final reading.
- 4) The hours of operation can be taken from an hour meter, an electric meter or will be assumed to be equal to the time between measurements.
- 5) If the unit is found down - try to determine how many hours it did operate and use the data taken for the previous period to make the calculations. Restart the unit and then take data to start the next period.

SAMPLE DATA AND CALCULATIONS

Date	Time	Temp deg F	Press in H ₂ O	HC conc mg/M ³	Vapor flow acfm	Calc. lb. rem.
1/6/95	11:00	70	-46	2000	120	
1/7/95	13:00	55	-50	1350	90	
1/8/95	10:00	80	-13	750	100	7.4

Calculate the pounds of hydrocarbon removed from the system during the basis period from 13:00 (1:00 pm) on the 7th to 10 am on the 8th. Pressure and temperature of the measurements (at the flow meter) must be corrected to the P and T used to report the HC concentration (which are P = 1 atm and T = 70 deg F). 1 atm = 14.7psia, 760 mm Hg, or 407 in H₂O. T_{abs} = 460 + T deg F

Hours of operation = 21, T = 80, P = -13, HC = (1350+750)/2 = 1050 mg/M³. Flow = 95

$$21 \times 60 \times 95 \times \frac{(460+70)}{(460+80)} \times \frac{(407-13)}{407} \times \frac{28.3}{1000} \times \frac{1050}{1000} \times \frac{1}{454} = 7.4 \text{ lb}$$

$$\frac{\text{hr}}{\text{basis}} \times \frac{\text{min}}{\text{hr}} \times \frac{\text{cu ft}}{\text{min}} \times T_{\text{Corr}} \times P_{\text{Corr}} \times \frac{\text{M}^3}{\text{cu ft}} \times \frac{\text{g}}{\text{M}^3} \times \frac{\text{lb}}{\text{g}} = \frac{\text{lb}}{\text{basis}}$$

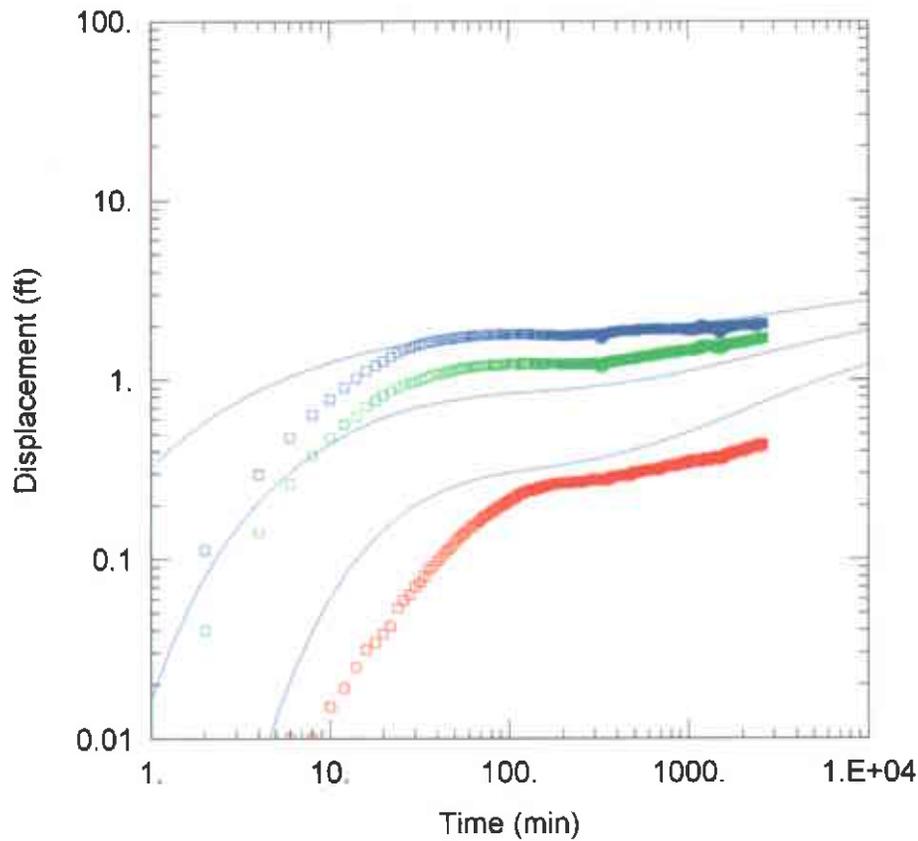

$$21 \times 60 \times 95 \times 0.98 \times 0.97 \times 0.0283 \times 1.050 \times 1/454 = 7.4 \text{ lb.}$$

cumulative lbs. (the running total) = the sum of all the previous periods.

Note: If results are given in ppm, an assumption about the molecular weight of the hydrocarbon must be made to convert ppm into mg/M³. ppmv x molecular wt. /24.1 = mg/M³. (Use 102 for gasoline)
