Cindy Dittmar of Bonkowski & Associates called regarding recent technical comments. I indicated that we would like an evaluation of the solvent detection in soil vapor sample. Current report only presents the soil vapor results with no comment re solvent detection. For second comment regarding detection limits, I requested some discussion as to how they reached conclusion that there was no vapor intrusion risk from fuel hydrocarbons with benzene reporting limit of 0.5 ug/l exceeding commercial ESL of 0.28 ug/L. Cindy Dittmar indicated that results were ND and I approved the work plan with proposed 8260 method. I indicated that most 8260 data for soil vapor samples that I review has better reporting limits than 0.5 ug/L and that I would check the Work Plan for reporting limits. She indicated work plan does not have reporting limits and that 0.5 ug/L reporting limit is the standard analysis. She has never seen better reporting limits. I did not agree. Conversation ended with request for presentation of the rationale to explain conclusion regarding risk.
