Re: **Document Transmittal**
Fuel Leak Case
76 Station #1156
4276 MacArthur
Oakland, CA

Dear Mr. Hwang:

Please find attached ATC's *Quarterly Summary Report - Second Quarter 2005*, dated 7/18/05, and TRC's *Quarterly Monitoring Report*, dated 5/11/05 for the above referenced site. I declare, under penalty of perjury, that to the best of my knowledge the information and/or recommendations contained in the attached proposal or report are true and correct.

If you have any questions or need additional information, please call me at (916) 558-7666.

Sincerely,

A handwritten signature in black ink, appearing to read "Thomas H. Kosek".

Thomas H. Kosek
Site Manager, Risk Management and Remediation
ConocoPhillips

QUARTERLY SUMMARY REPORT
Second Quarter 2005

76 Service Station No. 1156 / WNO 1112
4276 MacArthur Blvd.
Oakland, CA

City/County ID# Oakland
County: Alameda

SITE BACKGROUND AND ACTIVITY

The site is located at the northeast corner of MacArthur Boulevard and High Street in Oakland, California, as shown on the Vicinity Map (Figure 1). Two 12,000-gallon gasoline underground storage tanks (USTs) are present in the southwestern portion of the site and two dispenser islands are present on the site, one to the northwest and one to the east of the USTs. A station building is present in the northern portion of the site. There are currently seven groundwater monitoring wells (MW-1 through MW-7) and one tank backfill well (TP-1) located at and in the vicinity of the site. Pertinent site features are shown on the Site Map (Figure 2). Properties in the immediate vicinity of the site are utilized for commercial and residential purposes.

In 1997, Pacific Environmental Group Inc. (PEG) advanced 5 soil/gas probes in the vicinity of the USTs, dispenser islands, and product lines to depths ranging from 3 to 15 feet bgs. Elevated soil vapor concentrations of TPHg, benzene, and MTBE were detected up to 4,700, 70, and 140 micrograms per liter ($\mu\text{g/L}$), respectively. In 1998, Tosco Marketing Company (Tosco, now ConocoPhillips) removed one 280-gallon used-oil UST, and removed and replaced two 10,000-gallon gasoline USTs and associated piping and dispensers. The new USTs were installed in a separate excavation. TPH as diesel (TPHd), TPHg, benzene, and total recoverable petroleum hydrocarbons (TRPH) were detected in the soil sample from the used-oil UST cavity at a concentration of 78,000, 130, 0.55, and 8,400 milligrams per kilogram (mg/kg), respectively. Following the over-excavation of approximately 4.6 tons of soil from the used-oil UST cavity, concentrations of TPHd, TPHg, benzene, and TRPH were detected in soil samples collected from the used-oil UST cavity at concentrations up to 560, 81, 0.64, and 360 mg/kg, respectively. TPHg and benzene were detected in the soil samples from the gasoline UST cavity, dispenser islands, and product lines at concentrations up to 1,200 and 1.6 mg/kg, respectively. A groundwater sample collected from the gasoline UST cavity was reported to contain TPHg and MTBE at a concentration of 41,000 and 1,800 $\mu\text{g/L}$, respectively. Benzene was not detected in the groundwater sample at or above the laboratory detection limit.

In 1999, Environmental Resolutions Inc. (ERI) performed a soil and groundwater evaluation including the installation of four on-site groundwater monitoring wells (MW-1 through MW-4). Soil samples collected from the borings at a depth of 10.5 feet bgs were reported to contain TPHg, benzene, and MTBE at concentrations up to 6,800, 2.6, and 0.71 mg/kg, respectively. The soil sample from MW-1, near the former used-oil UST, was additionally analyzed for TPHd and TRPH, which were detected at concentrations of 140 and 73 mg/kg, respectively. A deep sample

(20.5 feet bgs) collected from MW-4 did not contain TPHg, benzene, or MTBE at or above the laboratory detection limit.

In July 2001, ERI installed a UST cavity backfill well (TP-1) and initiated monthly purging of groundwater from the UST cavity. Bi-weekly groundwater purging was conducted at the site on wells TP-1 and MW-1 from July 2001 through December 2004. In addition, during June 2004, the biweekly purging events included monitor well MW-7. Approximately 1,600 gallons were removed from well MW-7 with a cumulative total of approximately 476,000 gallons removed from the site through December 2004.

In August 2001, ERI installed three offsite monitor wells (MW-5 though MW-7). TPHg and MtBE were not detected in the soil samples and benzene was only detected in one soil sample (MW-7) at a concentration of 0.18 mg/kg.

Quarterly groundwater monitoring and sampling commenced July 1999 and is currently ongoing.

January 2005 – ATC became the new lead consultant for the site.

SENSITIVE RECEPTORS

2001 – A GeoTracker database search was conducted which revealed four public water supply wells owned by the East Bay Regional Park District (Park District), within a ½ mile radius of the site. Representatives from the Park District reported having no knowledge or records of any wells located in this area and indicated that the wells may have belonged to the East Bay Municipal Utility District (EBMUD); however EBMUD were also reported to have no knowledge or records of any wells located in this area.

2001 – A Department of Water Resources (DWR) database search was conducted which revealed four water supply wells belonging to Mills College, within the search area. A representative from Mills College indicated that all wells associated with Mills College had been destroyed approximately ten years ago (1991) and that Mills College was now connected to a municipal water supply. The DRW search also revealed a well located at 3397 Arkansas Street, approximately 880 feet outside of the search radius. No other wells, surface water-bodies, or potentially sensitive environmental habitats were identified during ERI's field receptor search.

MONITORING AND SAMPLING

The monitor well network is currently sampled on a quarterly basis. During the most recent groundwater monitoring event, conducted on March April 6, 2005, depth to groundwater elevations ranged from 1.15 feet in MW-6 to 5.96 feet in MW-7 below top of casing (TOC). The groundwater flow direction was toward the west at a gradient of 0.06 ft/ft, consistent with historic events. During the April 2005 sampling event, maximum detectable hydrocarbon concentrations were as follows: TPHg (85,000 ug/l in MW-1), benzene (8,400 ug/l in MW-1), and MtBE (17,000 ug/l in MW-7). The dissolved phase levels detected during the second quarter 2005 are consistent with the trends observed over the previous three quarters.

REMEDIATION STATUS

No active remediation presently ongoing at this site.

Approximately 1,350 tons of spoil and backfill were removed during the 1998 UST removal. As of December 23, 2004, approximately 476,015 gallons of groundwater have been purged from the site during bi-weekly groundwater purging events.

CHARACTERIZATION STATUS

Hydrocarbons in soil and groundwater are not delineated. Additional wells are proposed, pending approval, in the up- and down-gradient directions to assist in determining the hydrocarbon plume delineation. Additionally, a former Shell service station is located down gradient of the site and currently has elevated dissolved hydrocarbon and liquid phase hydrocarbons present in its onsite monitor wells.

Based on the receptor survey data and site conditions (soils less than 3 meters/residential land use and groundwater not considered a potential drinking water source), the Environmental Screening Levels (ESL) for this site are:

Compound	Groundwater (ug/l)	Wells Exceeding ESL	Soil ESL Residential (mg/kg)	Wells Exceeding ESL	Soil ESL Commercial (mg/kg)	Wells Exceeding ESL
Benzene	46	MW-1, MW-3, MW-4, MW-7	0.18	MW-1, MW-3, MW-4, MW7	0.38	---
Toluene	1300	MW-1, MW-3	9.3	MW-1	9.3	---
Ethyl benzene	2900	MW-1	32	MW-1	32	---
Xylenes	100	MW-1, MW-3	11	MW-1	11	---
MtBE	1800	MW-2, MW-7	2	---	5.6	---
TPH-g	500	MW-1, MW-2, MW-3, MW-4, MW-5, MW-7	10	MW-1	400	---

RECENT CORRESPONDENCE

ATC Associates submitted a Work Plan on May 24, 2005 for additional onsite and offsite subsurface investigation activity.

THIS QUARTER ACTIVITIES (Second Quarter 2005)

TRC performed the quarterly monitoring and sampling event (April 6, 2005) at the site. The monitoring report dated May 11, 2005 is attached.

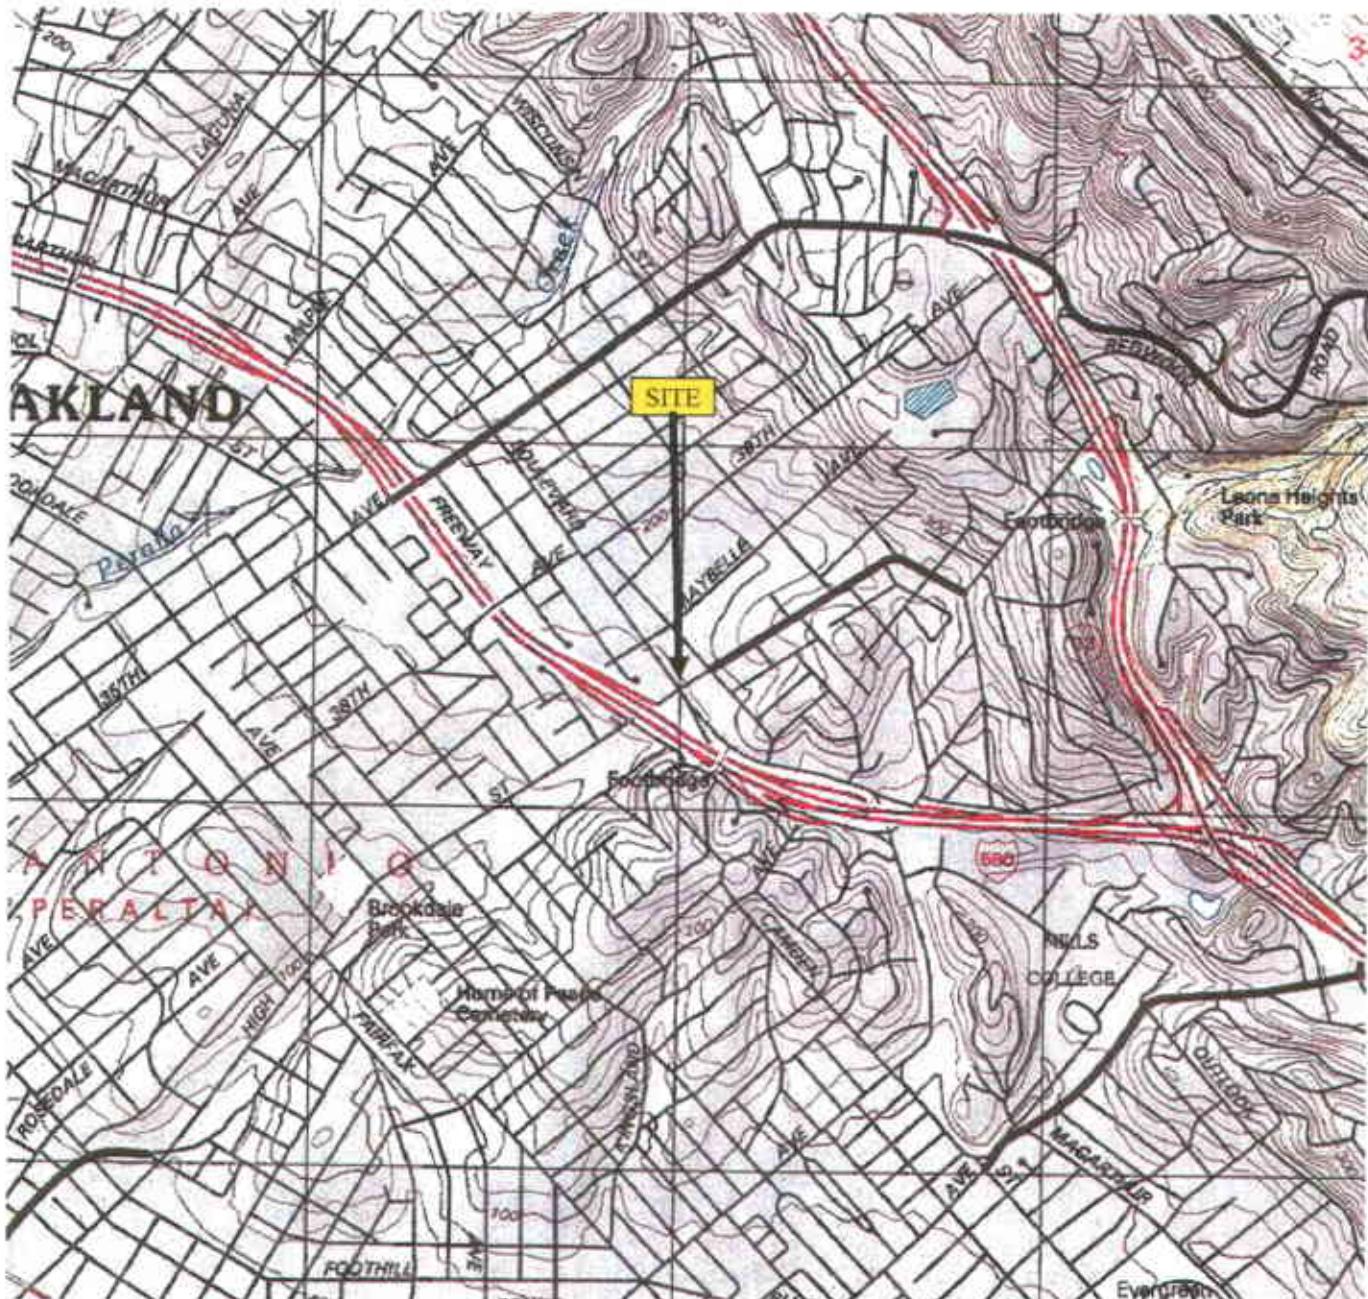

WASTE DISPOSAL SUMMARY

No waste was generated this quarter.

NEXT QUARTER ACTIVITIES (Second Quarter 2005)

1. The well network will be sampled and monitored by TRC.
2. ATC will submit a Work Plan for feasibility testing and preparation of a Corrective Action Plan.
3. ATC will perform a receptor survey and complete the proposed subsurface investigation, once approved by the Alameda County Department of Public Health.

RE: QUARTERLY MONITORING REPORT
APRIL THROUGH JUNE 2005

Dear Mr. Kosel:

Please find enclosed our Quarterly Monitoring Report for 76 Station 1156, located 4276 MacArthur Boulevard, Oakland, California. If you have any questions regarding this report, please call us at (949) 753-0101.

Sincerely,

TRC

Summary of Gauging and Sampling Activities
April 2005 through June 2005
76 Station 1156
4276 MacArthur
Oakland, CA

Project Coordinator: **Thomas Kosel** Water Sampling Contractor: **TRC**
Telephone: **916-558-7666** Compiled by: **Valentina Tobon**

Date(s) of Gauging/Sampling Event: **04/06/05**

Sample Points

Groundwater wells: **4** onsite, **3** offsite Wells gauged: **7** Wells sampled: **7**

Purging method: **Diaphragm pump**

Purge water disposal: **Onyx/Rodeo Unit 100**

Other Sample Points: **0** Type: **n/a**

Liquid Phase Hydrocarbons (LPH)

Wells with LPH: **0** Maximum thickness (feet): **n/a**

LPH removal frequency: **n/a** Method: **n/a**

Treatment or disposal of water/LPH: **n/a**

Hydrogeologic Parameters

Depth to groundwater (below TOC): Minimum: **0.95 feet** Maximum: **5.96 feet**

Average groundwater elevation (relative to available local datum): **170.42 feet**

Average change in groundwater elevation since previous event: **0.95 feet**

Interpreted groundwater gradient and flow direction:

Current event: **0.06 ft/ft, west**

Previous event: **0.07 ft/ft, southwest (01/17/05)**

Selected Laboratory Results

Wells with detected **Benzene**: **3** Wells above MCL (1.0 µg/l): **3**

Maximum reported benzene concentration: **8,400 µg/l (MW-1)**

Wells with **TPH-G** Maximum: **85,000 µg/l (MW-1)**

Wells with **MTBE** Maximum: **17,000 µg/l (MW-7)**

Notes:

TABLE KEY

STANDARD ABREVIATIONS

--	= not analyzed, measured, or collected
LPH	= liquid-phase hydrocarbons
Trace	= less than 0.01 foot of LPH in well
$\mu\text{g/l}$	= micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	= milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	= not detected at or above laboratory detection limit
TOC	= top of casing (surveyed reference elevation)

ANALYTES

BTEX	= benzene, toluene, ethylbenzene, and (total) xylenes
DIPE	= di-isopropyl ether
ETBE	= ethyl tertiary butyl ether
MTBE	= methyl tertiary butyl ether
PCB	= polychlorinated biphenyls
PCE	= tetrachloroethene
TBA	= tertiary butyl alcohol
TCA	= trichloroethane
TCE	= trichloroethene
TPH-G	= total petroleum hydrocarbons with gasoline distinction
TPH-D	= total petroleum hydrocarbons with diesel distinction
TPPH	= total purgeable petroleum hydrocarbons
TRPH	= total recoverable petroleum hydrocarbons
TAME	= tertiary amyl methyl ether
1,1-DCA	= 1,1-dichloroethane
1,2-DCA	= 1,2-dichloroethane (same as EDC, ethylene dichloride)
1,1-DCE	= 1,1-dichloroethene
1,2-DCE	= 1,2-dichloroethene (cis- and trans-)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation - Measured Depth to Water + (D_p x LPH Thickness), where D_p is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A "J" flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.
8. Groundwater vs. Time graphs may be corrected for apparent level changes due to resurvey.

REFERENCE

TRC began groundwater monitoring and sampling for 76 Station 1156 in October 2003. Historical data compiled prior to that time were provided by Gettler-Ryan Inc.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage, or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurement are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods,

sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, and the samplers initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging, and Sampling

The sequence in which monitoring activities are conducted are specified on the TSR. In general, wells are gauged beginning with the least-affected well and ending with the well that has highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected well to the most-affected well.

Decontamination

In order to reduce the possibility of cross-contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated to a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

Legend and Notes

Analysis Flag

L2

Reporting limits were raised due to high level of analyte present
in the sample.

Result Flag

Q1

Quantit. of unknown hydrocarbon(s) in sample based on gasoline.

Q6

The concentration reported reflect(s) individual or discrete unidentified
peaks not matching a typical fuel pattern.

STATEMENTS

Purge Water Disposal

Non-hazardous groundwater produced during purging and sampling of monitoring was accumulated at TRC's groundwater monitoring facility at Concord, California, for transportation by Onyx Transportation, Inc., to the ConocoPhillips Refinery at Rodeo, California. Disposal at the Rodeo facility was authorized by ConocoPhillips in accordance with "ESD Standard Operating Procedures - Water Quality and Compliance", as revised on February 7, 2003. Documentation of compliance with ConocoPhillips requirements is provided by an ESD Form R-149, which is on file at TRC's Concord Office. Purge water containing a significant amount of liquid-phase hydrocarbons was accumulated separately in drums for transportation and disposal by Filter Recycling, Inc.

Limitations

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.
