**Re: QUARTERLY SUMMARY REPORT
Third Quarter 2010
Fuel leak Case No. RO0000409**

Dear Mr. Wickham:

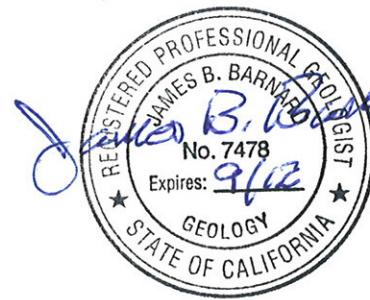

On behalf of ConocoPhillips Company (COP), Delta Consultants (Delta) is submitting the Semi-Annual Summary Report - Third Quarter 2010 and forwarding a copy of TRC Solutions, Inc. (TRC's) *Groundwater Monitoring Report - July through September 2010*, dated September 2, 2010, for the following location:

<u>Service Station</u>	<u>Location</u>
76 Service Station No. 1156	4276 MacArthur Boulevard Oakland, California

Sincerely,
DELTA CONSULTANTS

James B. Barnard, P.G.
Project Manager
California Registered Professional Geologist No. 7478

cc: Mr. Bill Borgh, ConocoPhillips (electronic copy)
Mr. Bob Hale, Alameda County Public Works Agency,
Water Resources Section

**QUARTERLY SUMMARY REPORT
THIRD QUARTER 2010
76 Service Station No. 1156
4276 MacArthur Boulevard
Oakland, California**

SITE DESCRIPTION

The site is located at the northeast corner of MacArthur Boulevard and High Street in Oakland, California. Two 12,000-gallon gasoline underground storage tanks (USTs) are located in the southwestern portion of the site and two dispenser islands are located at the site, one to the northwest and one to the east of the USTs. A station building is located in the northern portion of the site. There are currently eight groundwater monitoring wells (MW-1 through MW-8) and one tank backfill well (TP-1) located at and in the vicinity of the site. Properties in the immediate vicinity of the site are utilized for commercial and residential purposes.

PREVIOUS ASSESSMENT

In 1997, Pacific Environmental Group Inc. (PEG) advanced 5 soil/gas probes in the vicinity of the USTs, dispenser islands, and product lines to depths ranging from 3 to 15 feet below the ground surface (bgs). Elevated soil vapor concentrations of total petroleum hydrocarbons as gasoline (TPHg), benzene, and methyl tertiary butyl ether (MTBE) were reported at concentrations up to 4,700, 70, and 140 micrograms per liter ($\mu\text{g/L}$), respectively.

In 1998, Tosco Marketing Company (Tosco) removed one 280-gallon used-oil UST, and removed and replaced two 10,000-gallon gasoline USTs, associated piping, and fuel dispensers. The new USTs were installed in a separate excavation. Total petroleum hydrocarbons as diesel (TPHd), TPHg, benzene, and total purgeable petroleum hydrocarbons (TPPH) were reported in the soil sample collected from the used-oil UST excavation at concentrations of 78,000 milligrams per kilogram (mg/kg), 130 mg/kg, 0.55 mg/kg, and 8,400 mg/kg, respectively. Following the over-excavation of approximately 4.6 tons of soil from the used-oil UST excavation, concentrations of TPHd, TPHg, benzene, and TPPH were reported in soil samples collected from the used-oil UST excavation at concentrations up to 560, 81, 0.64, and 360 mg/kg, respectively. TPHg and benzene were reported in the soil samples collected from the gasoline UST excavation, dispenser islands, and product lines at concentrations up to 1,200 mg/kg and 1.6 mg/kg, respectively. Analytical data from a groundwater sample collected from the gasoline UST excavation indicated that TPHg and MTBE were present at concentrations of 41,000 $\mu\text{g/L}$ and 1,800 $\mu\text{g/L}$, respectively. Benzene was reported to be below the laboratory's indicated reporting limit in the groundwater sample collected for analysis.

In 1999, Environmental Resolutions Inc. (ERI) conducted a soil and groundwater assessment which included the installation of four on-site groundwater monitoring wells (MW-1 through MW-4). Analytical data from the soil samples collected from the borings at a depth of 10.5 feet bgs indicated TPHg, benzene, and MTBE were present at concentrations up to 6,800 mg/kg, 2.6 mg/kg, and 0.71 mg/kg, respectively. The soil sample from MW-1, near the former used-oil UST, was also analyzed for TPHd and TPPH. Analytical data from this soil sample indicated TPHd and TRPH were present at concentrations of 140 mg/kg and 73 mg/kg, respectively.

Analytical data from an additional soil sample collected at a depth of 20.5 feet bgs from the MW-4 boring indicated that TPHg, benzene, and MTBE were not present above the laboratory's indicated reporting limits. Quarterly groundwater monitoring and sampling activities commenced in July 1999 and are currently ongoing.

In July 2001, ERI installed a UST pit backfill well (TP-1) and initiated monthly purging of groundwater from the UST excavation. Bi-weekly groundwater purging was conducted at the site using wells TP-1 and MW-1 from July 2001 through December 2004.

In August 2001, ERI installed three off-site monitoring wells (MW-5 though MW-7). Analytical data from soil samples collected from these well borings indicated TPHg and MTBE were not present above the laboratory's indicated reporting limits. Analytical data indicated benzene was present in one soil sample collected from MW-7 at a concentration of 0.18 mg/kg.

In addition, during June 2004, the biweekly purging events included monitor well MW-7. Approximately 1,600 gallons of groundwater were removed from monitoring well MW-7 with a cumulative total of approximately 476,015 gallons removed from the site through December 2004.

ATC Associates became the new lead consultant for the site in January 2005.

Delta Consultants became the new consultant for the site in September 2005.

In October 2007, Delta advanced six soil borings on-site and installed an additional monitoring well, off-site, down-gradient of the former waste-oil tank location. The details of this investigation were presented in Delta's *Site Investigation Report*, dated December 28, 2007.

During the third quarter 2009, a semi-annual monitoring and sampling program was inducted for all groundwater monitoring wells in the network.

SENSITIVE RECEPTORS

2001 – A GeoTracker database search was conducted which indicated that four public water supply wells owned by the East Bay Regional Park District (Park District) are present within one-half mile of the site. Representatives from the Park District reported having no knowledge or records of any wells located in this area and indicated that the wells may have belonged to the East Bay Municipal Utility District (EBMUD); however EBMUD also reported no knowledge or records of any wells located in this area.

2001 – A Department of Water Resources (DWR) database search was conducted which indicated four water supply wells belonging to Mills College were present within the one-half mile search area. A representative from Mills College indicated that all wells associated with Mills College had been destroyed and Mills College was now connected to a municipal water supply. The DWR search also indicated a well was located at 3397 Arkansas Street, approximately 880 feet outside of the search area. No other wells,

surface water bodies, or potentially sensitive environmental habitats were identified during ERI's field receptor search.

2006 – A survey entailing a visit to the DWR office in Sacramento was conducted to examine well log records and identify domestic wells within the survey area. The DWR survey provided two potential receptors within one mile of the site; one irrigation well located 0.9 miles northwest of the site and one domestic/irrigation well located 1.0 mile northeast of the site. Two additional potential receptors were identified, although the specific addresses could not be verified.

MONITORING AND SAMPLING

The current sampling event occurred on August 2, 2010. At this time, the well network was still sampled on a semi-annual basis during first and third quarters. Following this sampling event, in mid to late August 2010, monitoring wells MW-1, MW-2, MW-3, MW-4, MW-6, and MW-8 have been abandoned. New wells MW-1B, MW-2B, MW-3B, and MW-4B have been installed. As of fourth quarter 2010, all wells will be gauged quarterly, wells MW-1B, MW-2B, MW-3B, and MW-4B will be sampled quarterly, and wells MW-5 and MW-7 will be sampled semi-annually during first and third quarters.

Groundwater samples collected are analyzed for total petroleum hydrocarbons as gasoline (TPHg) and total petroleum hydrocarbons as diesel (TPHd) by Environmental Protection Agency (EPA) method 8015, benzene, toluene, ethylbenzene, and total xylenes (BTEX), and 8 fuel oxygenates [methyl tert butyl ether (MTBE), tert butyl alcohol (TBA), diisopropyl ether (DIPE), tert amyl methyl ether (TAME), ethylene dibromide (EDB), 1,2 dichloroethane (1,2-DCA), ethyl tert butyl ether (ETBE), and ethanol] by EPA method 8260. Samples from MW-1 are additionally analyzed for total oil and grease (TOG).

TRC has been contracted to perform the monitoring and sampling at the site. A copy of TRC's *Groundwater Monitoring Report - July through September 2010*, dated September 2 2010, has been forwarded with this report. Analytical data and groundwater elevation data from the neighboring former Shell service station is also included in the attached TRC report.

During the current sampling event, MW-6 and MW-8 had been paved over and were not gauged or sampled.

During the most recent groundwater monitoring event, conducted on August 2, 2010, the depth to groundwater ranged from 2.2 feet (MW-5) to 7.08 feet (MW-7) below top of casing (TOC). The groundwater flow direction and gradient was interpreted to be to the west at a gradient of 0.07 feet per foot (ft/ft). This is consistent with the flow direction and gradient from the previous sampling event (2/1/10).

Historic groundwater flow directions are shown on a rose diagram presented as Attachment A.

Contaminants of Concern:

TPHg: TPHg was above laboratory indicated reporting limits in groundwater samples collected from all of the six wells sampled with a maximum concentration of 71,000 µg/L, in monitoring well MW-1. This is a decrease from a maximum concentration of 74,000 µg/L in this well during the previous sampling event (2/1/10). Wells MW-2, MW-3, MW-4, MW-5, and MW-7 were reported with concentrations of 1,200 µg/L, 8,600 µg/L, 470 µg/L, 64 µg/L, and 880 µg/L, respectively, during the current sampling event.

TPHd: TPHd was above laboratory indicated reporting limits in groundwater samples collected from four of the six wells sampled with a maximum concentration of 3,900 µg/L, in monitoring well MW-1. This is consistent with an identical maximum concentration of 3,900 µg/L in this well during the previous sampling event (2/1/10). Wells MW-2, MW-3, and MW-4 were reported with concentrations of 210 µg/L, 540 µg/L, and 120 µg/L, respectively, during the current sampling event.

Benzene: Benzene was above laboratory indicated reporting limits in groundwater samples collected from four of the six wells sampled with a maximum concentration of 7,000 µg/L in monitoring well MW-1. This is consistent with an identical maximum concentration in this well during the previous sampling event. Wells MW-2, MW-3, and MW-4 were reported with concentrations of 9.5 µg/L, 140 µg/L, and 17 µg/L, respectively, during the current sampling event.

Toluene: Toluene was above laboratory indicated reporting limits in groundwater samples collected from four of the six samples collected with a maximum concentration of 11,000 µg/L in MW-1 during the current sampling event. This is consistent with an identical maximum concentration in this well during the previous sampling event. Wells MW-2, MW-3, and MW-4 were reported with concentrations of 32 µg/L, 110 µg/L, and 3.4 µg/L, respectively, during the current sampling event.

Ethylbenzene: Ethylbenzene was above laboratory indicated reporting limits in groundwater samples collected from four of the six wells sampled with a maximum concentration of 3,300 µg/L in MW-1 during the current sampling event. This is an increase from a maximum concentration of 3,100 µg/L in this well during the previous sampling event. Wells MW-2, MW-3, and MW-4 were reported with concentrations of 1.4 µg/L, 320 µg/L, and 2.5 µg/L, respectively, during the current sampling event.

Total Xylenes: Total Xylenes were above laboratory indicated reporting limits in groundwater samples collected from four of the six wells sampled with a maximum concentration of 10,000 µg/L in MW-1 during the current sampling event. This is consistent with an identical maximum concentration in this well during the previous sampling event. Wells MW-2, MW-3, and MW-4 were reported with concentrations of 2.4 µg/L, 1,000 µg/L, and 12 µg/L, respectively, during the current sampling event.

MTBE: MTBE was above laboratory indicated reporting limits in groundwater samples collected from 5 of the six wells sampled with a maximum concentration of 770 µg/L in MW-7 during the current sampling event. This is an increase from a maximum concentration of 720 µg/L in this well during the previous sampling event. Wells MW-2,

MW-3, MW-4, and MW-5 were reported with concentrations of 290 µg/L, 97 µg/L, 51 µg/L, and 120 µg/L, respectively, during the current sampling event.

Fuel Oxygenates: EBD was analyzed in samples collected from 3 wells, and was below laboratory indicated reporting limits in all three during the current sampling event. 1,2-DCA was analyzed in samples collected from all six wells, and was above laboratory in two of the six samples with concentrations of 1.4 µg/L and 1.9 µg/L in MW-4 and MW-7, respectively, during the current sampling event

TOG: TOG was analyzed in the sample collected from MW-1, and was below laboratory indicated reporting limits.

REMEDIATION STATUS

No active remediation is presently ongoing at this site.

Approximately 1,350 tons of soil and backfill were removed during the 1998 UST removal. As of December 23, 2004, approximately 476,015 gallons of groundwater were pumped from the site during bi-weekly groundwater extraction from wells MW-1, MW-7, and TP-1. The groundwater extraction program was discontinued in December 2004.

CHARACTERIZATION STATUS

A former Shell service station down-gradient from the site currently has elevated petroleum hydrocarbons present in groundwater as evidenced in samples collected from on-site monitor wells (27,000 µg/L total purgeable petroleum hydrocarbons (TPPH), 3,000 µg/L benzene, and 1,400 µg/L MTBE in groundwater samples from Shell monitor well MW-3).

RECENT CORRESPONDENCE

In a letter dated January 21, 2009, the Alameda County Environmental Health Care Services (ACEHD) rejected Delta's proposal to proceed with a pilot test of ozone/oxygen injection at the site. The *Work Plan- Additional Site Investigation*, dated December 15, 2008, had been the third document in succession (submitted by Delta) that has not been acceptable for implementation at this site. As such, ACEHD advised that a Revised Work Plan would be required by the given March 23, 2009 deadline. The revised workplan was submitted by Delta to the ACEH on March 19, 2009 under a separate cover and approved May 1, 2009.

In June of 2009, Delta completed Site Assessment activities, as proposed in the March 2009 (revised) Site Assessment Workplan. Assessment activities were summarized in the September 8, 2009 Site Investigation Report. In response to the report, ACEH submitted a letter to COP, requesting additional investigation to further evaluate the vertical and horizontal extent of petroleum hydrocarbon impact on and off-site. In addition ACEH requested further confirmation of a black viscous product encountered during the June 2009 investigation.

Delta submitted a *Workplan for Additional Site Assessment* dated March 3, 2010.

Work proposed in *Workplan for Additional Site Assessment* was approved in a ACEH letter dated April 5, 2010.

THIRD QUARTER ACTIVITIES

1. TRC conducted the quarterly monitoring and sampling event at the site on August 2, 2010, and prepared and submitted their results in *Groundwater Monitoring Report – July through September*, dated September 2, 2010.
2. Delta prepared *Quarterly Summary Report – Third Quarter 2010*.
3. Delta performed field activities associated with the scope of work outlined in *Workplan for Additional Site Assessment*

FOURTH QUARTER ACTIVITIES

1. Delta will prepare and submit the results of field activities associated with the scope of work presented in *Workplan for Additional Site Assessment*, by October 29, 2010, as approved by ACEH.
2. TRC will conduct the quarterly groundwater monitoring and sampling event at the site.
3. Delta will prepare and submit a quarterly summary report.

RE: GROUNDWATER MONITORING REPORT
JULY THROUGH SEPTEMBER 2010

Dear Mr. Borgh:

Please find enclosed our Groundwater Monitoring Report for 76 Station 1156, located at 4276 MacArthur Boulevard, Oakland, California. If you have any questions regarding this report, please call us at (949) 727-9336.

Sincerely,

A handwritten signature in black ink. It includes the letters "TRC" in a stylized font inside a circle, followed by a larger, more fluid signature of "Anju Parfan". A small vertical line or flourish is drawn to the right of the name.

TABLES

TABLE KEY

STANDARD ABBREVIATIONS

--	=	not analyzed, measured, or collected
LPH	=	liquid-phase hydrocarbons
µg/l	=	micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	=	milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	=	not detected at or above laboratory detection limit
TOC	=	top of casing (surveyed reference elevation)
D	=	duplicate
P	=	no-purge sample

ANALYTES

DIPE	=	di-isopropyl ether
ETBE	=	ethyl tertiary butyl ether
MTBE	=	methyl tertiary butyl ether
PCB	=	polychlorinated biphenyls
PCE	=	tetrachloroethene
TBA	=	tertiary butyl alcohol
TCA	=	trichloroethane
TCE	=	trichloroethylene
TPH-G	=	total petroleum hydrocarbons with gasoline distinction
TPH-G (GC/MS)	=	total petroleum hydrocarbons with gasoline distinction utilizing EPA Method 8260B
TPH-D	=	total petroleum hydrocarbons with diesel distinction
TRPH	=	total recoverable petroleum hydrocarbons
TAME	=	tertiary amyl methyl ether
1,2-DCA	=	1,2-dichloroethane (same as EDC, ethylene dichloride)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation – Measured Depth to Water + (Dp x LPH Thickness), where Dp is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A "J" flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.
8. Prior to the 1st quarter 2010, the word "monitor" was used in table comments interchangeably with the word "gauge". Starting in the 1st quarter 2010, the word "monitor" is used to include both "gauge" and "sample".

REFERENCE

TRC began groundwater monitoring and sampling for 76 Station 1156 in October 2003. Historical data compiled prior to that time were provided by Gettler-Ryan Inc.

Abbreviations:

TPPH = Total petroleum hydrocarbons as gasoline by EPA Method 8260B; prior to July 24, 2001, analyzed by EPA Method 8015.

BTEX = Benzene, toluene, ethylbenzene, xylenes by EPA Method 8260B; prior to July 24, 2001, analyzed by EPA Method 8020.

MTBE = Methyl tertiary butyl ether

DIPE = Di-isopropyl ether, analyzed by EPA Method 8260

ETBE = Ethyl tertiary butyl ether, analyzed by EPA Method 8260

TAME = Tertiary amyl methyl ether, analyzed by EPA Method 8260

TBA = Tertiary butyl alcohol, analyzed by EPA Method 8260

TOC = Top of Casing Elevation

SPH = Separate-Phase Hydrocarbons

GW = Groundwater

ug/L = Parts per billion

MSL = Mean sea level

ft. = Feet

<n = Below detection limit

(D) = Duplicate sample

NA = Not applicable

DO = Dissolved Oxygens

ppm = Parts per million

ORP = Oxidation Reduction Potential

mV = Millivolts

Notes:

a = Ground water surface had a sheen when sampled.

b = MTBE value is estimated by Sequoia Analytical of Redwood City, CA.

c = The concentration reported reflects individual or discrete unidentified peaks not matching a typical fuel pattern.

d = Secondary ion abundances were outside method requirements. Identification based on analytical judgement.

e = pH>2

f = Initial analysis within holding time. Reanalysis for the required dilution or confirmation was past holding time.

g = Analyzed by EPA Method 8015B (M).

h = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based upon the specified standard.

i = Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.

* = Sample analyzed outside the EPA recommended holding time.

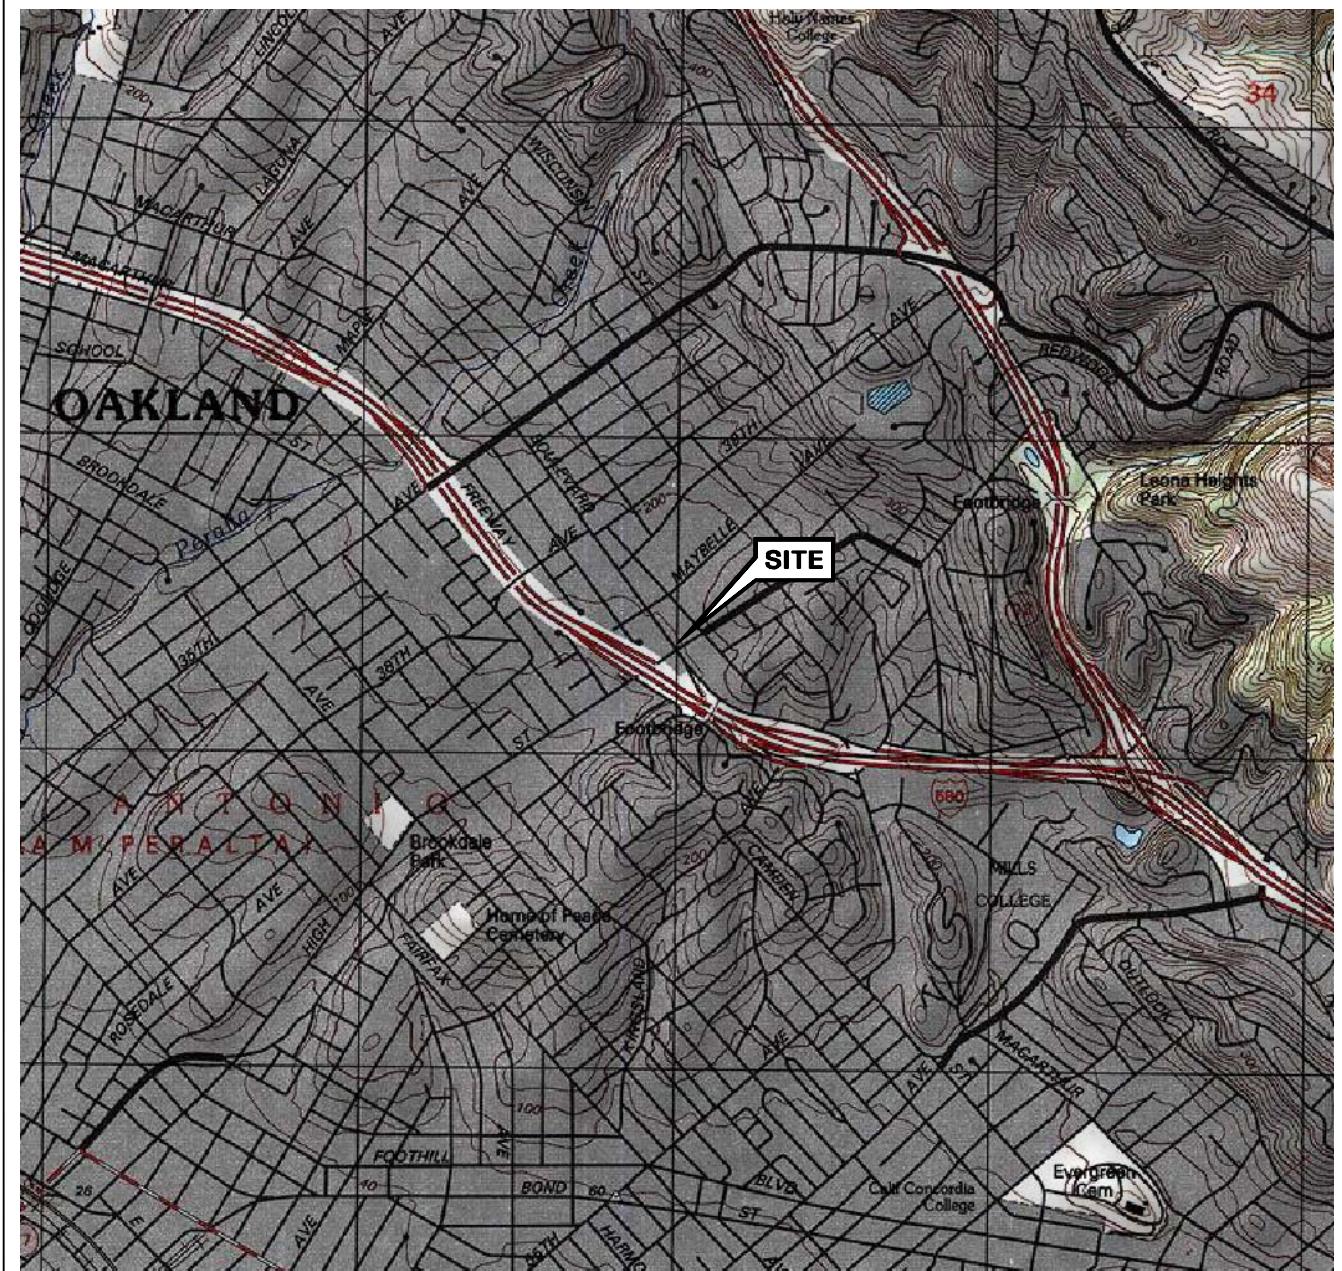

Ethanol analyzed by EPA Method 8260B.

Site surveyed March 14, 2002 by Virgil Chavez Land Surveying of Vallejo, CA.

When separate-phase hydrocarbons are present, ground water elevation is adjusted using the relation: Corrected ground water elevation = Top-of-Casing Elevation - Depth to Water + (0.8 x Hydrocarbon Thickness).

Wells MW-6, MW-7, MW-8 and MW-9 surveyed July 12, 2006 by Virgil Chavez Land Surveying of Vallejo, CA.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurements are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, sample time, and the sampler's initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging and Sampling

The sequence in which monitoring activities are conducted is specified on the TSR. In general, wells are gauged beginning with the least affected well and ending with the well that has the highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected to the most-affected well.

Decontamination

In order to reduce the possibility of cross contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging, and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A17	Surrogate not reportable due to sample dilution.
A52	Chromatogram not typical of diesel.
A91	TPH does not exhibit a "gasoline" pattern. TPH is entirely due to MTBE.
Q03	Matrix spike recovery(s) is(are) not within the control limits.
V11	The Continuing Calibration Verification (CCV) recovery is not within established control limits.
Z1	Run at lowest possible dilution to avoid carry-over of unreported analytes.

STATEMENTS

Purge Water Disposal

Non-hazardous groundwater produced during purging and sampling of monitoring wells is accumulated at TRC's groundwater monitoring field office at Concord, California, for transportation by a licensed carrier to an authorized disposal facility. Currently, non-hazardous purge water is transported under a bulk non-hazardous waste manifest to Crosby and Overton, Inc. in Long Beach, California.

Limitations

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.
