Re: **Document Transmittal**
Fuel Leak Case
76 Station #1156
4276 MacArthur
Oakland, CA

Dear Mr. Hwang:

Please find attached Miller Brook's *Quarterly Status Report*, dated 10/25/04, and TRC's *Quarterly Monitoring Report*, dated 10/8/04 for the above referenced site. I declare, under penalty of perjury, that to the best of my knowledge the information and/or recommendations contained in the attached proposal or report is true and correct.

If you have any questions or need additional information, please call me at (916) 558-7666.

Sincerely,

A handwritten signature in black ink, appearing to read "Thomas H. Kosel".

RE: **Quarterly Summary Report-Third Quarter 2004**
Miller Brooks Environmental, Inc. Project No.: 06-459-1156-04

Dear Mr. Hwang:

On behalf of ConocoPhillips Company (ConocoPhillips), Miller Brooks Environmental, Incorporated (Miller Brooks) is forwarding the quarterly summary report for the following location:

Service Station

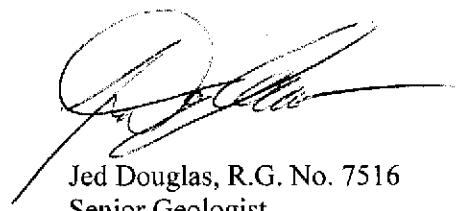

76 Service Station No. 1156
COP NO. WNO.1112

Location

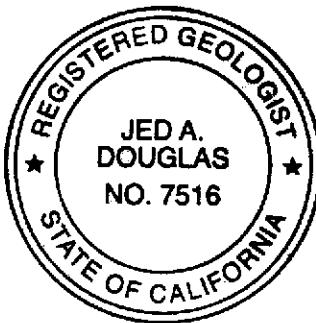

4276 MacArthur Boulevard
Oakland, California

Sincerely,

Miller Brooks Environmental, Incorporated

Jed Douglas, R.G. No. 7516
Senior Geologist

Attachment: Site Plan

cc: Mr. Thomas Kosel, ConocoPhillips

QUARTERLY SUMMARY REPORT
Third Quarter 2004

76 Service Station No. 1156
4276 MacArthur Boulevard
Oakland, California

City/County ID #: Oakland

County: Alameda

PREVIOUS ASSESSMENT

In 1998, Tosco Marketing Company (Tosco, now ConocoPhillips) removed one 280-gallon used-oil underground storage tank (UST) and removed and replaced two 10,000-gallon gasoline USTs and associated piping and dispensers. Laboratory analyses of samples collected during the work detected concentrations of petroleum hydrocarbons and related constituents in soil and groundwater beneath the site.

In 1999, Environmental Resolutions Inc. (ERI) performed a soil and groundwater evaluation including the installation of four on-site groundwater monitoring wells (MW1 through MW4). The results of the investigation indicated that the extent of petroleum hydrocarbons in soil and groundwater was not delineated.

In July 2001, ERI installed a UST cavity backfill well (TP1) and initiated regular purging of groundwater from the UST cavity.

In August 2001, ERI installed three off-site groundwater monitoring wells (MW5 through MW7). Total petroleum hydrocarbons as gasoline (TPHg) and methyl tertiary butyl ether (MTBE) were not detected in the soil samples and benzene was only detected in one soil sample at a concentration of 0.18 milligrams per kilogram (mg/kg).

SENSITIVE RECEPTORS

In 2001, a GeoTracker® database search, conducted by ERI, revealed four public water supply wells, owned by the East Bay Regional Park District (Park District), within a ½ mile radius of the site. Representatives from the Park District were reported to have no knowledge or records of any wells located in this area and indicated that the wells may belong to the East Bay Municipal Utility District (EBMUD); however, EBMUD were also reported to have no knowledge or records of any wells located in this area.

A 2001 Department of Water Resources (DWR) database search conducted by ERI revealed four water supply wells, belonging to Mills College, within the search radius. A representative from Mills College indicated that all wells associated with Mills College had been destroyed approximately ten years ago (1991) and that Mills College is now connected to a municipal water supply. The DWR search also revealed a well located at 3397 Arkansas Street, approximately 880 feet outside of the search radius. No other wells, surface water-bodies, or potentially sensitive environmental habitats were identified during ERI's field receptor survey.

MONITORING AND SAMPLING

During the most recent groundwater monitoring and sampling event, conducted on July 12, 2004, groundwater was present at depths ranging from 2.56 to 9.44 feet below the top of casing (TOC). The groundwater flow direction was reported towards the west with a gradient of 0.07 ft/ft which was consistent with the historical groundwater flow direction. During the July 12, 2004 sampling event, TPHg, benzene, and MTBE were present at concentrations up to 57,000, 6,900, and 11,000 micrograms per liter ($\mu\text{g/L}$), respectively.

REMEDIATION STATUS

Approximately 1,350 tons of soil and backfill were removed during the 1998 UST removal. As of September 17, 2004, approximately 341,320 gallons of groundwater have been purged from the site during the bi-weekly groundwater purging events.

CHARACTERIZATION STATUS

Groundwater at the site does not appear to be delineated. A former shell service station is located downgradient of the site.

RECENT CORRESPONDENCE

There was no correspondence during the reporting period.

THIS QUARTER ACTIVITIES (Third Quarter 2004)

1. The third quarter groundwater monitoring and sampling event for the site was performed by TRC Companies (TRC).
2. In addition, bi-weekly groundwater purging events from well MW-1 and TP-1 were performed at the site. During June and July 2004, four purging events from well MW-7 were performed. Groundwater purging from well MW-7 was terminated after July.

WASTE DISPOSAL SUMMARY

Approximately 19,880 gallons of groundwater from beneath the site were removed during the third quarter bi-weekly groundwater extraction events. The purged groundwater was properly disposed of at the ConocoPhillips refinery located in Rodeo, California.

NEXT QUARTER ACTIVITIES (Fourth Quarter 2004)

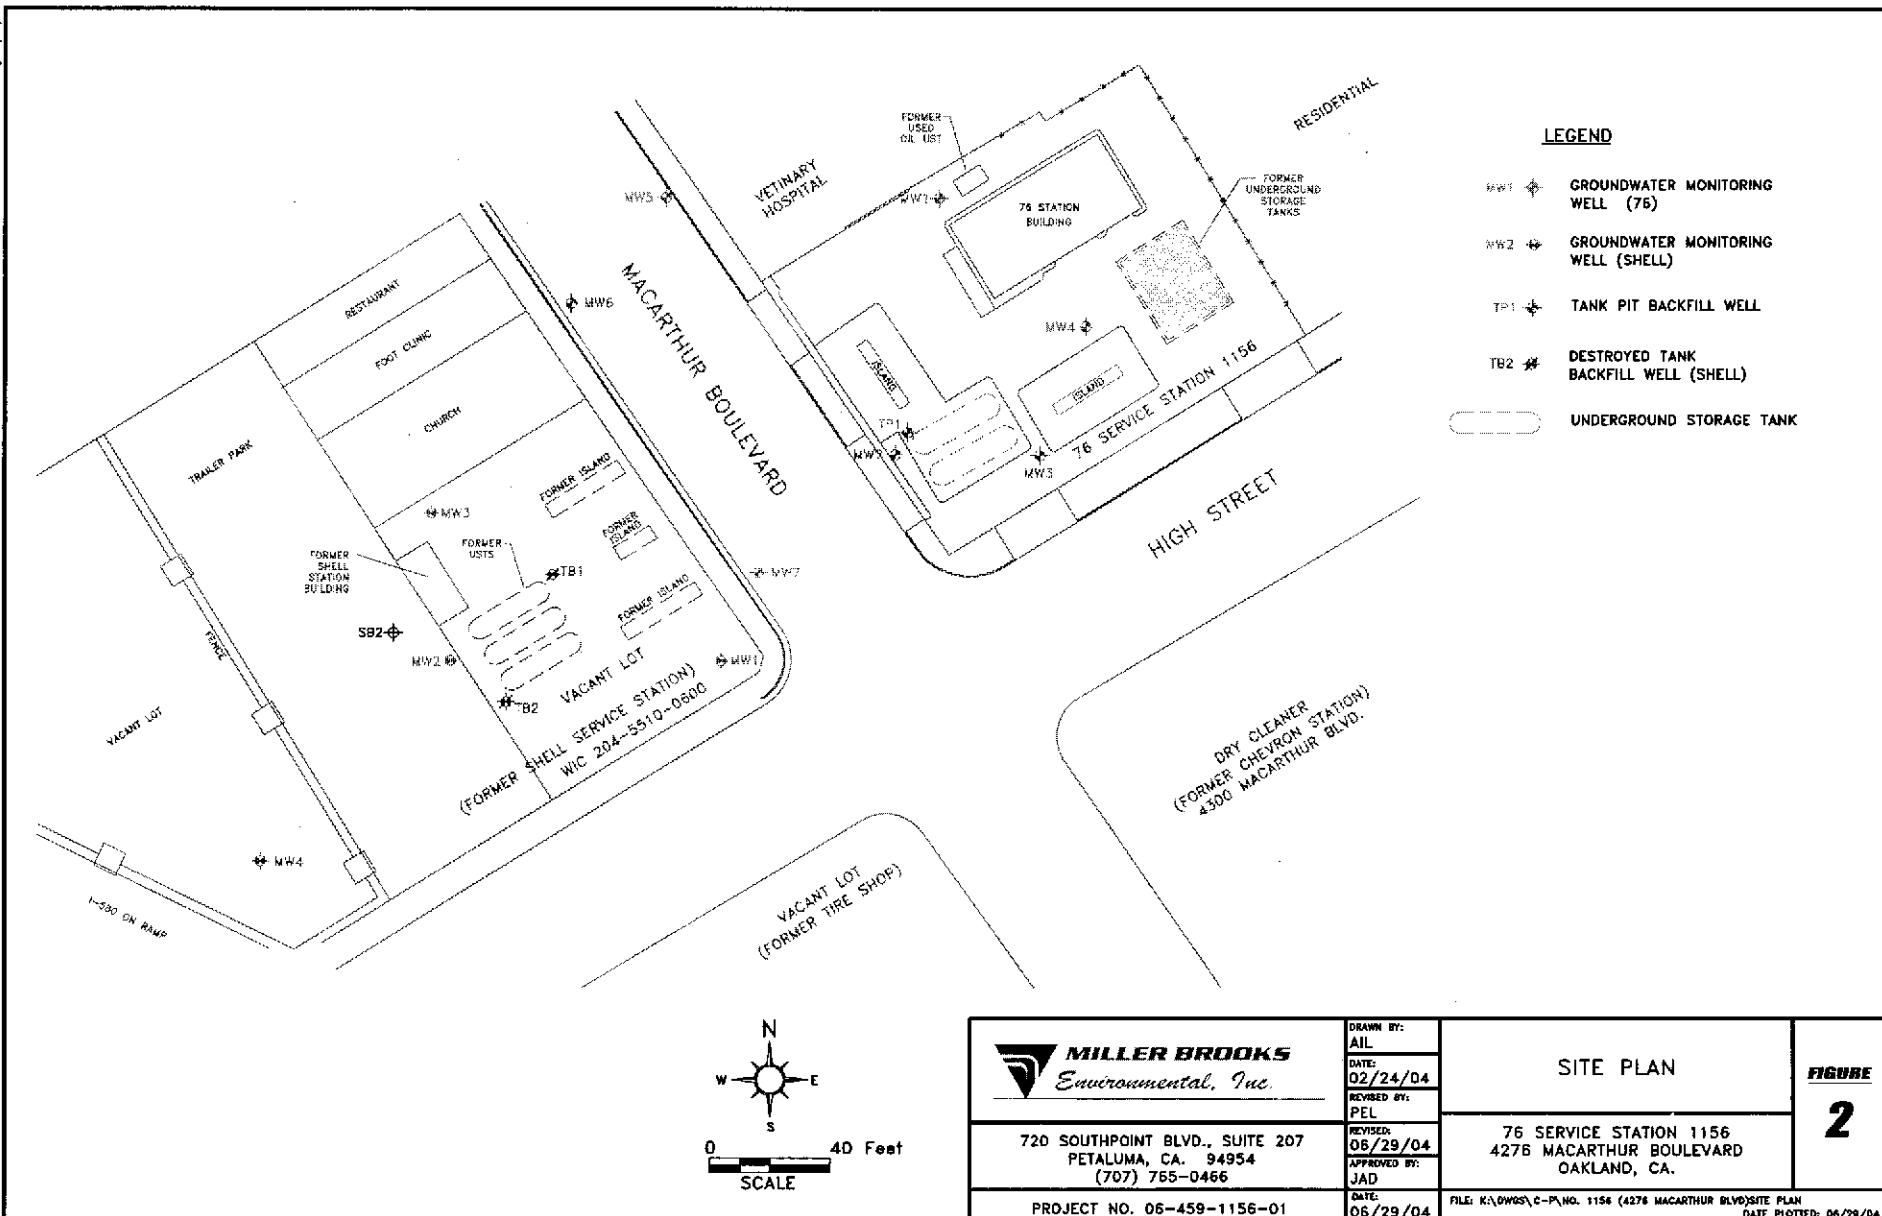

1. The well network will be sampled and a Groundwater Monitoring and Sampling Report will be submitted by TRC.
2. Bi-weekly groundwater purging from wells MW-1, and TP-1 will continue to be performed at the site. During the June and July groundwater purging from well MW-7, approximately 450 gallons were removed from the well prior to the groundwater sampling event. Hydrocarbon concentrations appear to have decreased significantly in well MW-7 based on data obtained during the third quarter sampling event. Miller Brooks will evaluate groundwater data from the fourth quarter sampling event, and if

*76 Service Station No. 1156
4276 MacArthur Blvd., Oakland, California
October 25, 2004*

concentrations in MW-7 appear to be increasing, groundwater purging may be re-initiated for the well.

3. Miller Brooks plans to prepare and submit a Corrective Action Plan (CAP) for the site.

Oakland, CA

Project Coordinator: **Thomas Kosei** Water Sampling Contractor: **TRC**
Telephone: **916-558-7666** Compiled by: **Valentina Tobon**

Date(s) of Gauging/Sampling Event: **07/12/04**

Sample Points

Groundwater wells: **4** onsite, **3** offsite Wells gauged: **7** Wells sampled: **7**
Purging method: **Diaphragm pump**
Purge water disposal: **Onyx/Rodeo Unit 100**
Other Sample Points: **0** Type: **n/a**

Liquid Phase Hydrocarbons (LPH)

Wells with LPH: **0** Maximum thickness (feet): **n/a**
LPH removal frequency: **n/a** Method: **n/a**
Treatment or disposal of water/LPH: **n/a**

Hydrogeologic Parameters

Depth to groundwater (below TOC): Minimum: **2.56 feet** Maximum: **9.44 feet**
Average groundwater elevation (relative to available local datum): **168.02 feet**
Average change in groundwater elevation since previous event: **-0.72 feet**
Interpreted groundwater gradient and flow direction:

Current event: **0.07 ft/ft, west**
Previous event: **0.05 ft/ft, west (04/28/04)**

Selected Laboratory Results

Wells with detected **Benzene**: **6** Wells above MCL (1.0 µg/l): **6**
Maximum reported benzene concentration: **6,900 µg/l (MW-1)**

Wells with **TPH-G** **6** Maximum: **57,000 µg/l (MW-1)**
Wells with **MTBE** **5** Maximum: **11,000 µg/l (MW-7)**

Notes:

SVOC results for MW-1: Benzoic Acid=36ug/L; 2-Methylnaphthalene=170ug/L;
Naphthalene=450ug/L; 2,4-Dimethylphenol=29ug/L; 2-Methyphenol=26ug/L; 3-4-Methylphenol=42ug/L

TABLES

TABLE KEY

STANDARD ABREVIATIONS

--	=	not analyzed, measured, or collected
LPH	=	liquid-phase hydrocarbons
Trace	=	less than 0.01 foot of LPH in well
$\mu\text{g/l}$	=	micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	=	milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	=	not detected at or above laboratory detection limit
TOC	=	top of casing (surveyed reference elevation)

ANALYTES

BTEX	=	benzene, toluene, ethylbenzene, and (total) xylenes
DIPE	=	di-isopropyl ether
ETBE	=	ethyl tertiary butyl ether
MTBE	=	methyl tertiary butyl ether
PCB	=	polychlorinated biphenyls
PCE	=	tetrachloroethene
TBA	=	tertiary butyl alcohol
TCA	=	trichloroethane
TCE	=	trichloroethene
TPH-G	=	total petroleum hydrocarbons with gasoline distinction
TPH-D	=	total petroleum hydrocarbons with diesel distinction
TPPH	=	total purgeable petroleum hydrocarbons
TRPH	=	total recoverable petroleum hydrocarbons
TAME	=	tertiary amyl methyl ether
1,1-DCA	=	1,1-dichloroethane
1,2-DCA	=	1,2-dichloroethane (same as EDC, ethylene dichloride)
1,1-DCE	=	1,1-dichloroethene
1,2-DCE	=	1,2-dichloroethene (cis- and trans-)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation - Measured Depth to Water + (D_p x LPH Thickness), where D_p is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A "J" flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.
8. Groundwater vs. Time graphs may be corrected for apparent level changes due to re-survey.

REFERENCE

TRC began groundwater monitoring and sampling for 76 Station 1156 in October 2003. Historical data compiled prior to that time were provided by Gettler-Ryan Inc.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage, or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurement are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, and the samplers initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging, and Sampling

The sequence in which monitoring activities are conducted are specified on the TSR. In general, wells are gauged beginning with the least-affected well and ending with the well that has highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected well to the most-affected well.

Decontamination

In order to reduce the possibility of cross-contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated to a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

Attn: ANJU FARFAN

Project Number: 1156
COC Number:
BCL Number: 04-07313

Dear Anju Farfan:

This report contains the analytical results for the samples received under chain of custody by BC Laboratories, Inc. The samples were logged into the Laboratory Information Management System (LIMS) and BC Lab numbers were assigned to each sample. The result of the temperature check, condition of the samples and any other discrepancies were recorded on the cooler receipt form.

All applicable quality control procedures met method-specific acceptance criteria, except as noted on the following analytical and quality control reports.

This report shall not be reproduced except in full, without written approval of the laboratory.

Volatile Organic Analysis (EPA Method 8260)

Sample Description

1156, MW-1, 07/12/2004 @ 23:10, Carrillo

Flag	Explanations
L02	The Laboratory Control Sample Water (LCSW) recovery is not within method established control limits.
V11	The Continuing Calibration Verification (CCV) recovery is not within established control limits.
Comments	
PQL's and MDL's are raised due to sample dilution.	

California DOHS Certification #1186

Flag	Explanations
A09	PQL's were raised due to high concentration of target analytes requiring sample dilution.
C02	The relative standard deviation of the calibration curve response factors exceeds the control limit.
L01	The Laboratory Control Sample Water (LCSW) recovery is not within laboratory established control limits.
M06	The internal standard on the Method Blank was not within the control limits.
M07	The surrogate recovery on the Method Blank for this compound was not within the control limits.
Q03	Matrix spike recovery is not within the control limits.
S09	The surrogate recovery on the sample for this compound was not within the control limits.
V11	The Continuing Calibration Verification (CCV) recovery is not within established control limits.

Flag	Explanations
A01	PQL's and MDL's are raised due to sample dilution.
Q02	Matrix spike precision is not within the control limits.
S01	Sample result is not within the quantitation range of the method.

STATEMENTS

Purge Water Disposal

Non-hazardous groundwater produced during purging and sampling was accumulated at TRC's groundwater monitoring facility at Concord, California, for transportation by Onyx Transportation, Inc., to the ConocoPhillips Refinery at Rodeo, California. Disposal at the Rodeo facility was authorized by ConocoPhillips in accordance with "ESD Standard Operating Procedures – Water Quality and Compliance", as revised on February 7, 2003. Documentation of compliance with ConocoPhillips requirements is provided by an ESD Form R-149, which is on file at TRC's Concord Office. Purge water suspected of containing potentially hazardous material, such as liquid-phase hydrocarbons, was accumulated separately in a drum for transportation and disposal by Filter Recycling, Inc.

Limitations

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.
