Subject: Soil and Ground Water Investigation Results
United Airlines Oakland Maintenance Center
Oakland International Airport, Oakland, California

Dear Ms. Graham and Mr. Chan:

The purpose of this letter is to notify the San Francisco Bay Regional Water Quality Control Board (RWQCB) and Alameda County Health Care Services (ACHCS) of the results of soil and ground water sampling recently completed at United Airlines' (UAL) Oakland Maintenance Center (OMC), located at 1100 Airport Drive in Oakland, California (Figure 1). On UAL's behalf, Environmental Resources Management (ERM) performed the investigation in connection with UAL's exit of the OMC on 31 May 2003. A formal site investigation report will be submitted to the RWQCB and ACHCS in July 2003. This forthcoming report will provide detailed descriptions of the investigation methods and results. The following sections of this letter provide site background information, a summary of the investigation, the analytical results, and closing remarks. The information contained in this letter has also been submitted to the Port of Oakland, which owns the property.

Weiss Associates, consultant to the Port of Oakland, conducted a concurrent soil and ground water investigation that was coordinated with ERM's work on behalf of UAL. It is our understanding that the Port of Oakland will submit an

investigation report to the RWQCB and ACHCS in the near future to provide their data.

SITE BACKGROUND

The OMC is an approximately 39.09-acre facility that UAL has leased from the Port of Oakland since 1988 for maintenance on wide-body aircraft. The OMC property is located within the Oakland International Airport in a predominantly commercial/industrial area. Figure 2 presents a recent aerial photograph of the OMC and areas immediately surrounding the property. As shown, the surrounding area includes storm water drainage channels/ponds and an aircraft taxiway connecting the North Field and South Field of the airport to the north; Sally Ride Way to the east beyond which is additional parking for the airport and the runway and taxiways for the North Field; Airport Drive to the south beyond which is the long-term parking area, rental car facilities, and unoccupied wetlands; and an access road and the economy parking lot to the west.

An approximately 309,910 square foot structure containing four adjoining hangars is the primary building on the OMC property. The area surrounding the hangar building is paved with either asphalt or concrete, and is primarily used for aircraft movement. As seen on Figure 3, the hangar and surrounding areas contain a number of structures and facilities related to aircraft maintenance.

The current area of the OMC property was within San Francisco Bay until the late 1950s or early 1960s, when filling began to construct the South Field of the airport, which opened in 1962. The filled area now occupied by the OMC remained undeveloped until 1973, when the hangar building and surrounding paved taxiways and aircraft parking areas were constructed. World Airways was the property tenant from its initial construction in 1973 until UAL's occupancy began in 1988. World Airways conducted aircraft maintenance and associated activities during its period of occupation at the OMC.

SUMMARY OF WORK

The initial task of the investigation was to identify potential areas of concern where soil and/or ground water sampling might be warranted. Based on this initial phase of work, 19 areas of potential concern (AOCs) were identified, as shown on Figure 3.

As also seen on Figure 3, ERM subsequently collected soil and/or ground water samples from 47 locations in April 2003. In addition, ground water samples were collected from five existing on-site wells (UAL-MW-1 through UAL-MW-3, P-1, and P-2). Soil samples were collected by a hand auger/slide hammer or a Geoprobe rig, depending upon location and depth. Ground water samples were collected from temporary PVC wells installed with the Geoprobe rig. Based on the analytical results, 10 permanent monitoring wells were subsequently installed in three of the AOCs (AOC 1, AOC 2, and AOC 3) during May 2003 to confirm the results of grab samples collected during the initial investigation. Sequoia Analytical, a State-certified laboratory in Walnut Creek, California, analyzed the soil and ground water samples for a variety of potential contaminants.

ANALYTICAL RESULTS

This data submittal is not intended to document the methods and results of the investigation in detail. The goal is to notify the RWQCB and ACHCS of the types and concentrations of chemicals detected at the site. Detailed information will be presented in the forthcoming site investigation report.

Table 1 lists the samples collected during the investigation and the analyses performed on each sample. The results for volatile organic compounds (VOCs), total purgeable petroleum hydrocarbons (TPPH), total extractable petroleum hydrocarbons (TEPH), and semivolatile organic compounds (SVOCs) detected in soil samples are presented in Table 2. Metals detected in soil samples are presented in Table 3. Polychlorinated biphenyls were analyzed for in a number of samples but were not detected. For comparison purposes, the tables present United States Environmental Protection Agency (USEPA) Region IX Preliminary Remedial Goals (PRGs) for VOCs, SVOCs, and metals. RWQCB Risk-Based Screening Levels (RBSLs) are presented for comparison with the TPPH and TEPH results.

Table 4 presents the results for VOCs, TPPH, TEPH, and SVOCs detected in ground water. Table 5 presents the results of ground water metals analyses. California Maximum Contaminant Levels are presented for comparison purposes for VOCs, SVOCs, and metals. RWQCB RBSLs for TPPH and TEPH in ground water are provided as well.

The analytical data are summarized in maps (Figures 4 through 18) to present the results of the evaluation for individual and grouped AOCs. These figures indicate whether compounds of a given class of chemical (VOCs, BTEX, TEPH,

TPPH, metals, PCBs, and SVOCs) were detected within soil (brown) and/or ground water (blue) samples collected at each location and whether the concentrations detected were above or below screening criteria (RBSLs, MCLs, PRGs). In addition, compounds detected at concentrations in excess of the appropriate screening criteria are identified on the figures along with the concentration detected and the appropriate screening level highlighted in yellow.

Based on the detected concentrations and site hydrogeologic conditions, we do not believe that the soil and ground water impacts in the investigated areas are likely to be areally extensive or that any constituents of concern are migrating to human or ecological receptors. This issue will be further evaluated and discussed in the forthcoming investigation report.

CLOSING

This letter has been submitted to inform the RWQCB and ACHCS that various chemical compounds have been detected in soil and ground water samples collected at the OMC. UAL intends to submit a formal site investigation report to the RWQCB and ACHCS in July 2003. In addition, it is our understanding that the Port of Oakland will submit the results of Weiss Associates' concurrent investigation of the OMC in the near future. We have provided the Port of Oakland with the information presented herein, and will also provide the Port with a copy of the July 2003 report.

Following your review of this letter, we would be happy to meet with you and representatives of the Port to discuss the site. If you have any questions or comments, please contact me at (925) 946-0455.

Sincerely,

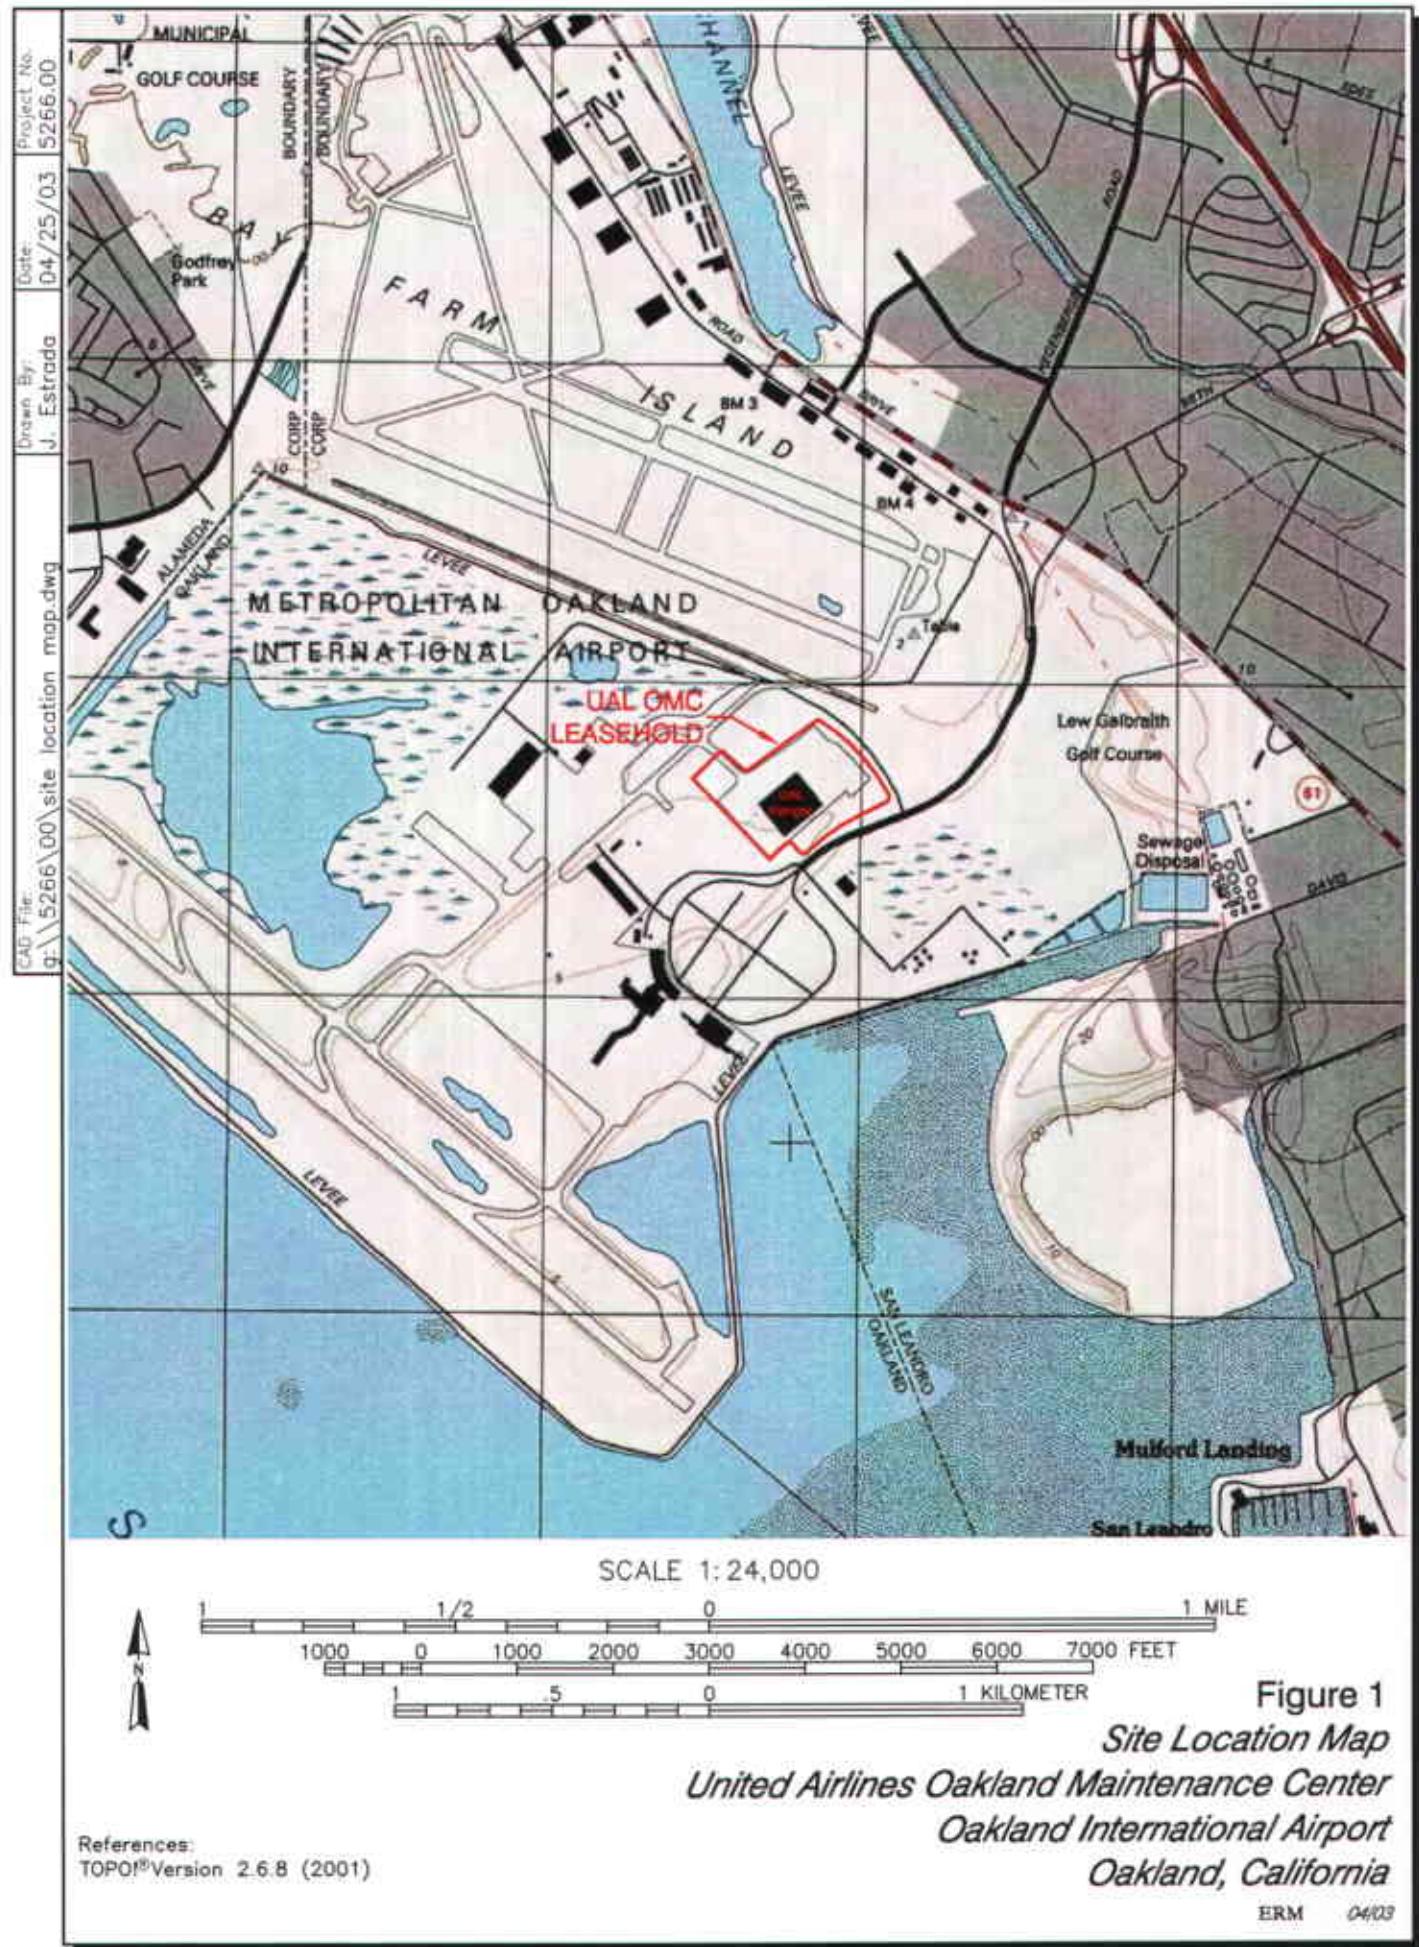

Jim Warner, R.G.
Principal

JBW/jal/5310.10

cc: Mr. Dan Tisoncik, United Airlines
Mr. Dale Klettke, Port of Oakland

The figure consists of three horizontal bars. The top bar is labeled 'FEET' and has numerical markings from 3000 to 7000. The middle bar is labeled 'KILOMETER' and has a single marking at 1 KILOMETER. The bottom bar is unlabeled. Below the bars, the text reads: 'United Airlines Oakland Maintenance Center', 'Oakland International Airport', and 'Oakland, California'.

Notes:

Sample concentrations reported in milligrams per kilogram (mg/kg)

* Location ERM-B-11 was analyzed for PCB-1016, -1221, -1232, -1242, -1248, -1254, and -1260; no PCB concentrations were detected.

Residential RBSL (Non-Potable Water) = Residential Risk Based Screening Level for shallow soil where potentially impacted ground water is not a current or potential drinking water resource. (Table B-1 of Application of Risk-Based Screening Levels and Decision Making to Site with Impacted Soil and Ground Water, RWQCB, December 2001)

Commercial RBSL (Non-Potable Water) = Commercial Risk Based Screening Level for shallow soil where potentially impacted ground water is not a current or potential drinking water resource. (Table B-2 of Application of Risk-Based Screening Levels and Decision Making to Site with Impacted Soil and Ground Water, RWQCB, December 2001)

PRG = Preliminary Remedial Goal (EPA Region 9 PRG Table, 1 October 2002)

Bold values indicate concentrations detected above the laboratory method detection limit

<0.5 Compound not detected at or above the laboratory method detection limit

Indicates a concentration detected above the respective RBSL

NS PRG not established

NA Not Analyzed

Abbreviations:

VOC = Volatile Organic Compounds	NAP = Naphthalene
TPH = Total Petroleum Hydrocarbons	1,2,4-TMB = 1,2,4-Trimethylbenzene
SVOC = Semi-Volatile Organic Compounds	1,3,5-TMB = 1,3,5-Triisopropylbenzene
PCB = Polychlorinated Biphenyls	BZ = Benzene
N-BB = n-Butylbenzene	EB = Ethylbenzene
SEC-BB = sec-Butylbenzene	TOL = Toluene
DCM = Dichloromethane	XYL = Xylenes
IPB = Isopropylbenzene	TEPH = Total Extractable Petroleum Hydrocarbons
P-IPT = p-Isopropyltoluene	TEPH SGCU = Total Extractable Petroleum Hydrocarbons - with Silica Gel Cleanup
MTBE = Methyl tert-butyl ether	TPPH = Total Purgeable Petroleum Hydrocarbons

ERM Qualifiers:

J = Estimated Value

UJb = Estimated Non-Detected Value Due to Common Laboratory Contaminant

NJ = Tentative Identification Estimated

feet bgs feet below ground surface

380/<0.42* Bold indicates the initial result by inductively coupled plasma/*italicized* indicates the result after reanalysis by graphite furnace

The initial thallium results were obtained using an inductively coupled plasma method. Concentrations of iron and aluminum within the samples can cause interferences for certain elements including thallium. The reanalysis using the graphite furnace method indicates that this interference is occurring with the samples collected during this investigation and the samples most likely contain concentrations similar to that detected by the graphite furnace analysis.

Abbreviations:

Hg = Mercury	Pb = Lead
Sb = Antimony	Mo = Molybdenum
As = Arsenic	Ni = Nickel
Ba = Barium	Se = Selenium
Be = Beryllium	Ag = Silver
Cd = Cadmium	Tl = Thallium
Cr = Chromium	V = Vanadium
Co = Cobalt	Zn = Zinc
Cu = Copper	

ERM Qualifiers:

J = Estimated Value
UJ = Estimated Non-detected Value
